

Uncertainties for criticality-safety benchmarks and consequences for nuclear data measurements

D. Rochman, A.J. Koning and S.C. van der Marck

*Nuclear Research and Consultancy Group,
NRG, Petten, The Netherlands*

May 14, 2009

Contents

① Motivations for a change:

\implies *a roadmap to consistent and state-of-the-art evaluations*

② Concept:

\implies *Monte Carlo from nuclear data evaluations to large-scale systems*

③ How does it work ?

\implies *TALYS + Monte Carlo*

④ Examples with $^{235,238}\text{U}$, $^{238,242}\text{Pu}$ and ^{244}Cm isotopes:

\implies *k_{eff} uncertainties and feedback to differential data for $^{238,242}\text{Pu}$ and ^{244}Cm*

⑤ Conclusions

Motivations: How to produce consistent (and reproducible) evaluations ?

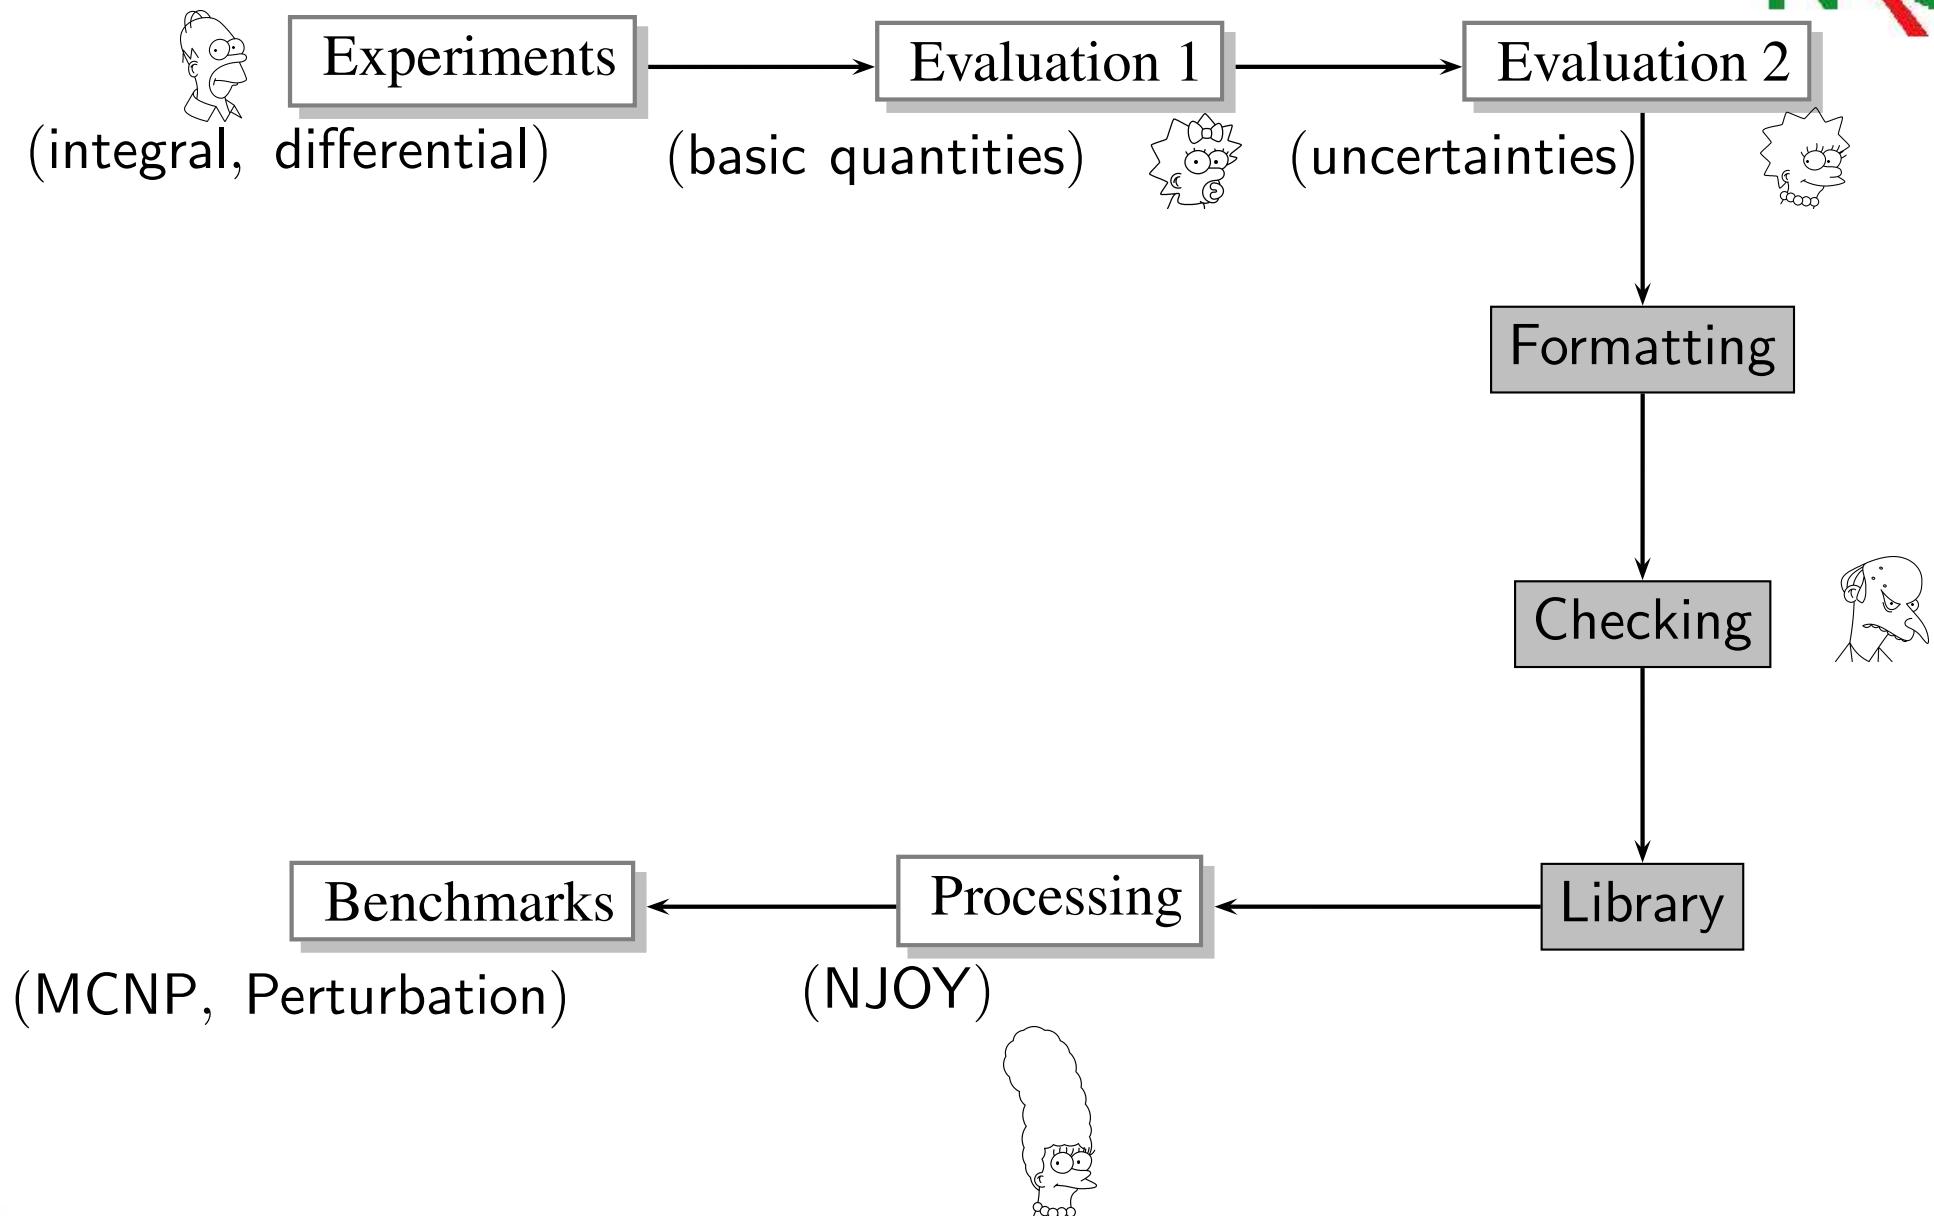

Usual procedures in evaluations imply

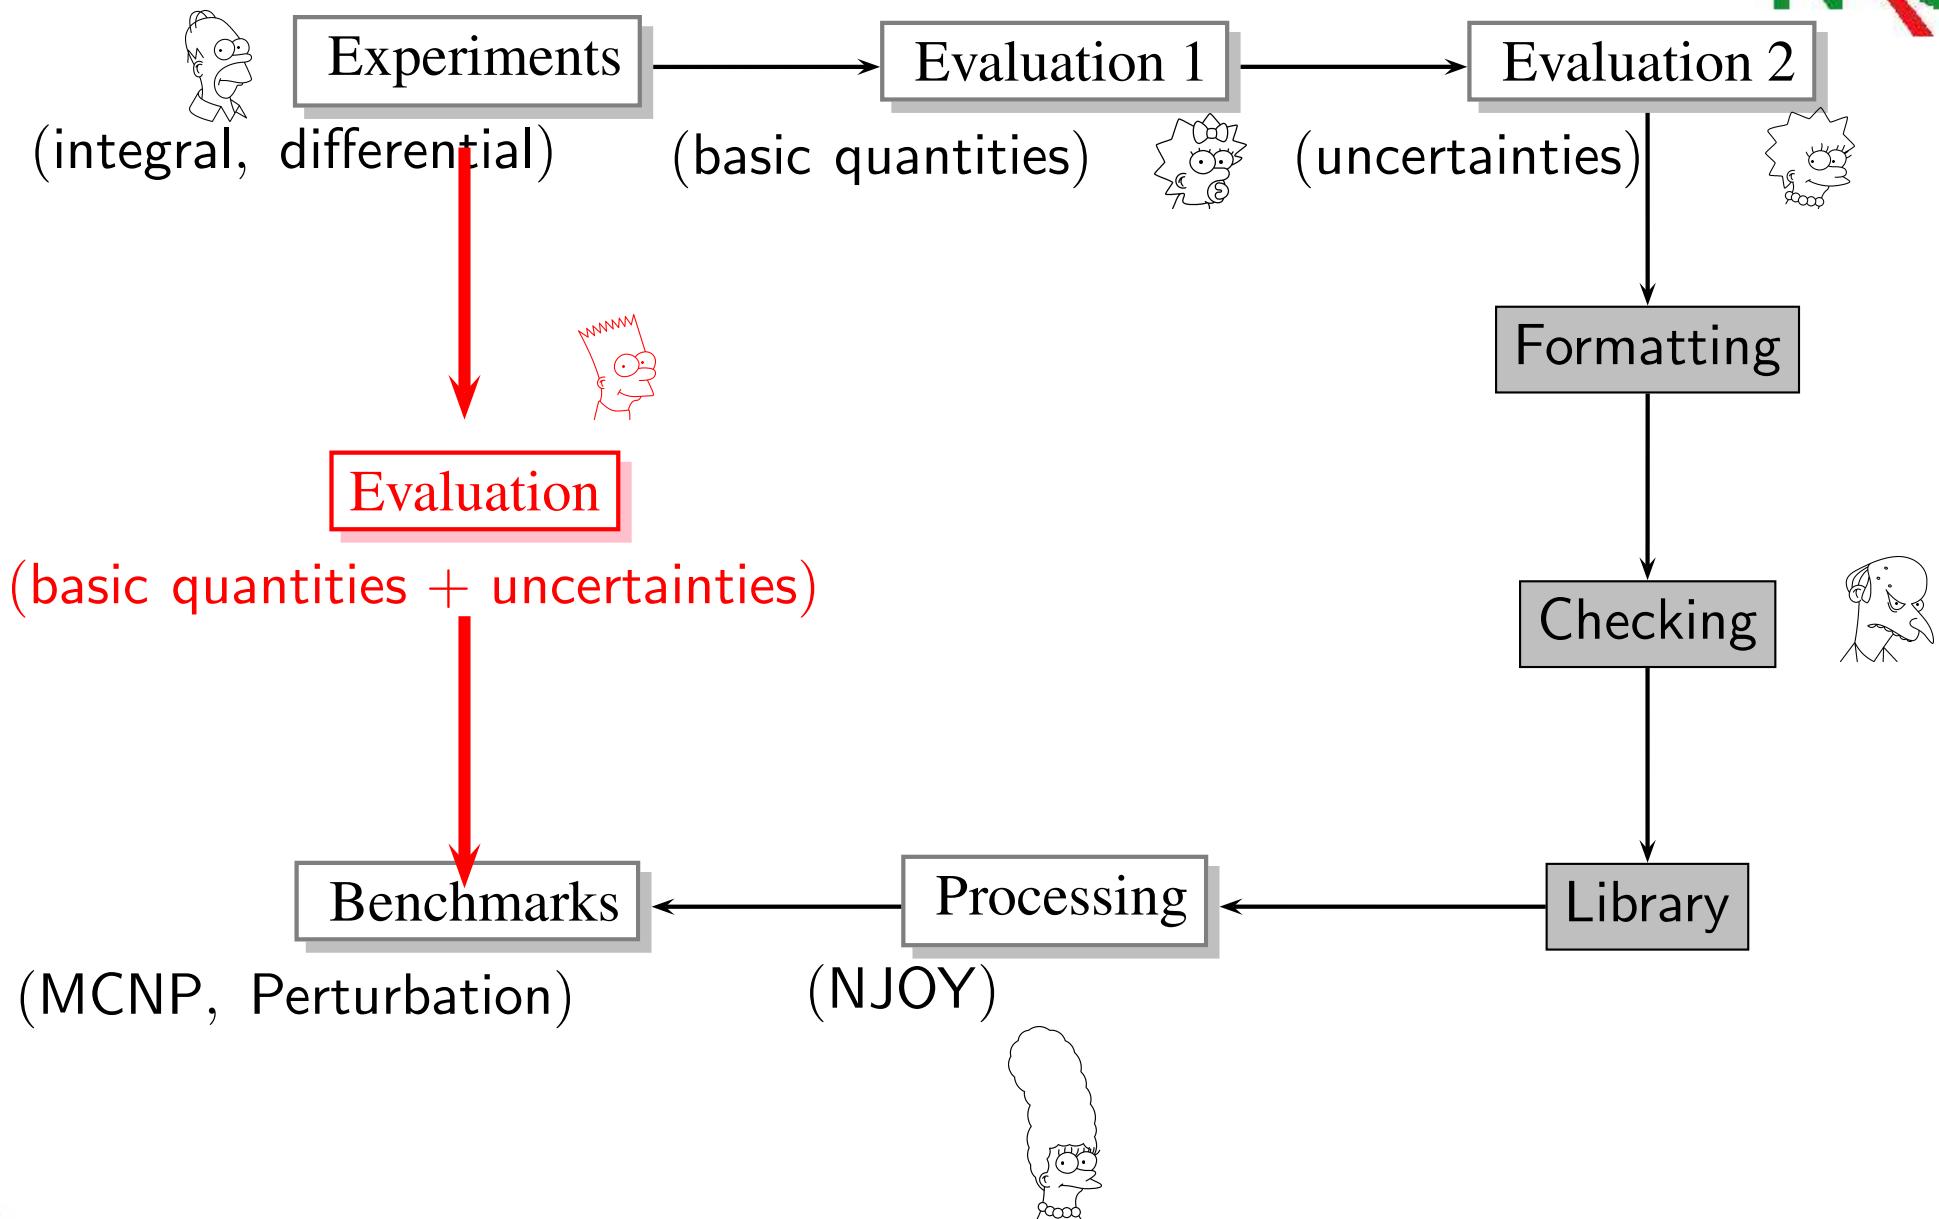

- ☞ First, there were measurements,
- ☞ Then nuclear reaction codes (TALYS, GNASH, EMPIRE...),
- ☞ Format the output semi-manually to ENDF file,
- ☞ Compare with experimental cross sections,
- ☞ Modify manually the ENDF file,
- ☞ Compare with integral tests,
- ☞ Modify manually the ENDF file, ENDF file ready,
- ☞ At last, "Industry can use evaluations", but...

► How include propagation of nuclear data uncertainties with a minimum number of approximation ?

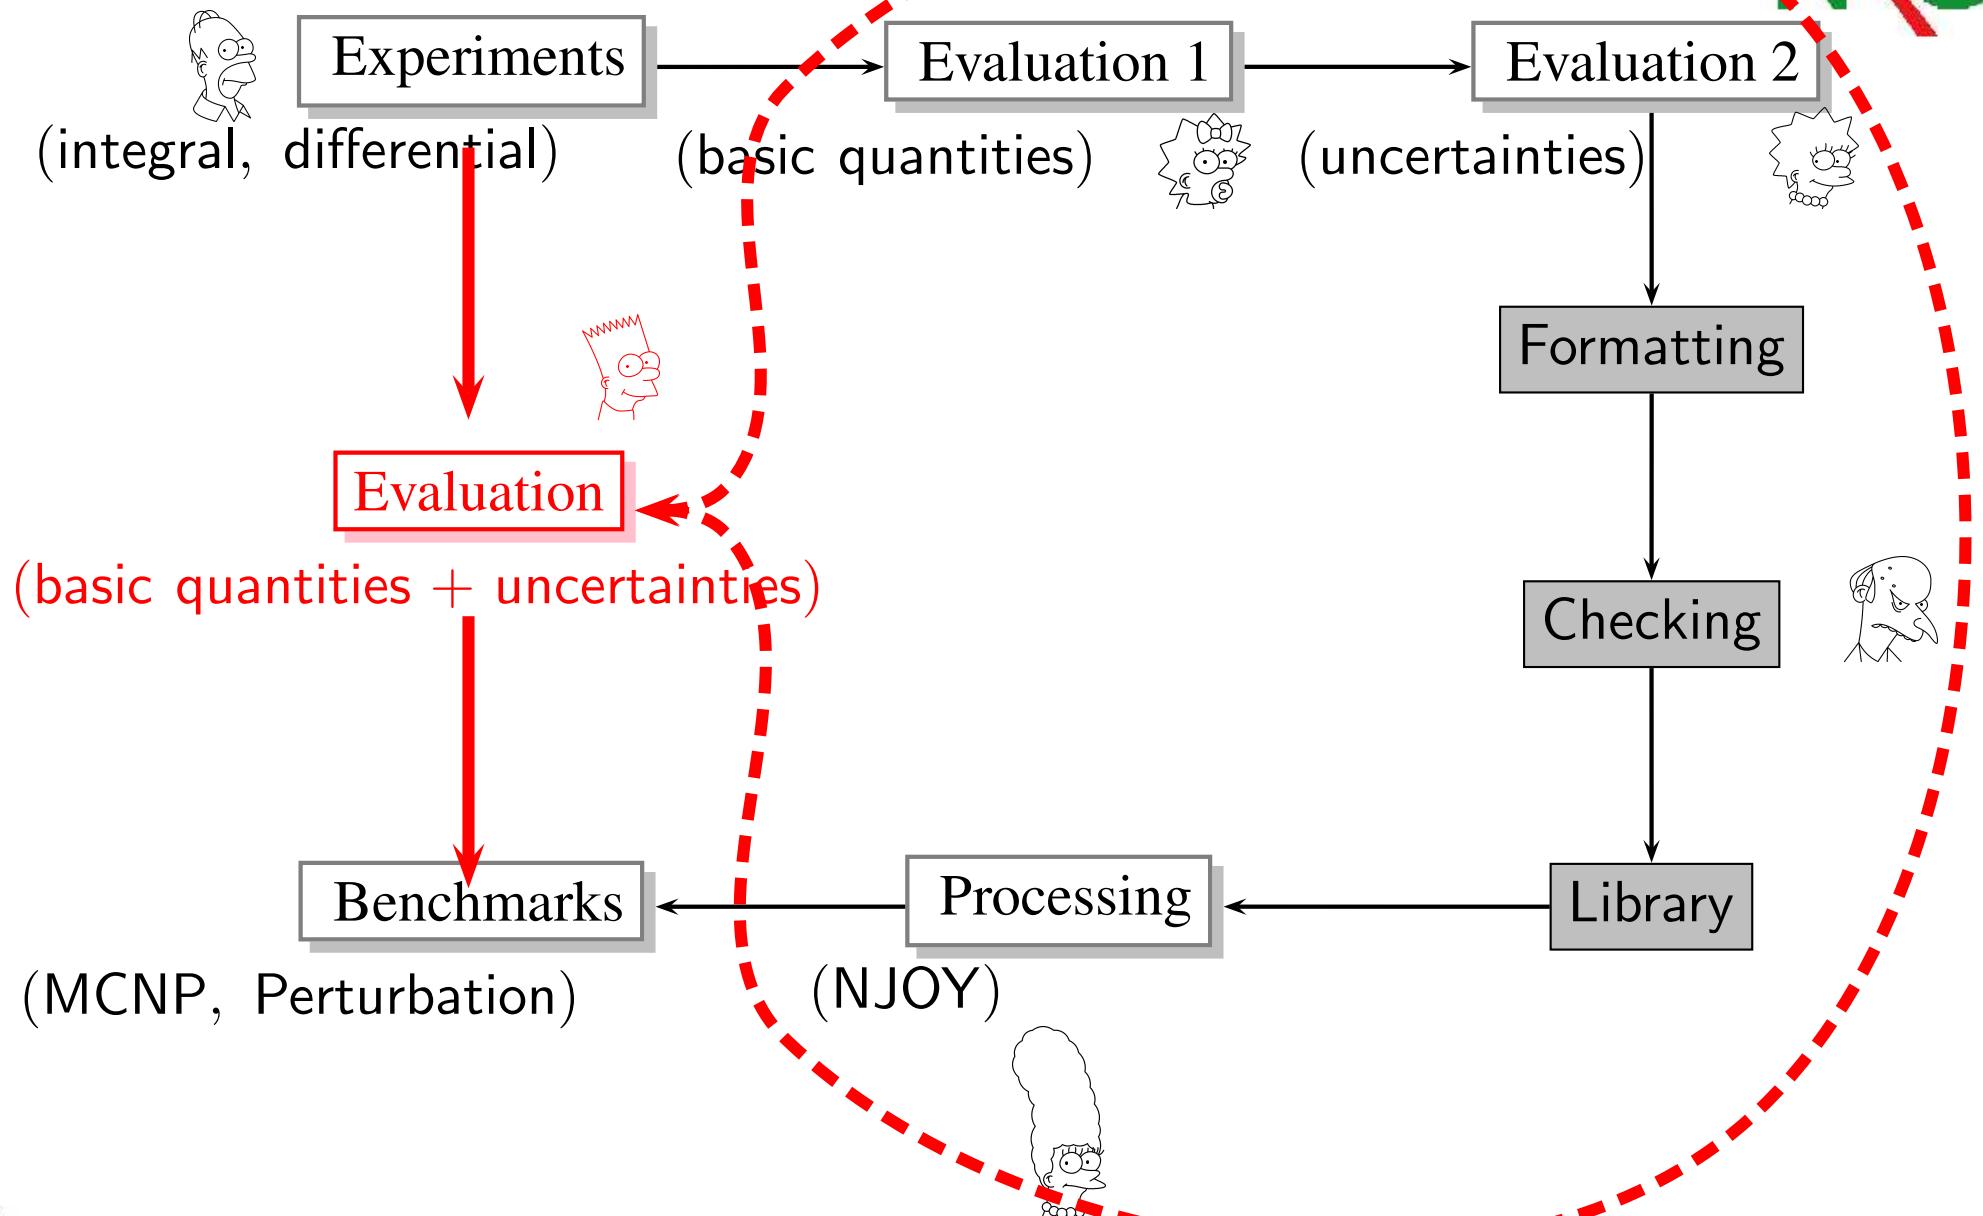

Concept: No more delocalization

Concept: No more delocalization

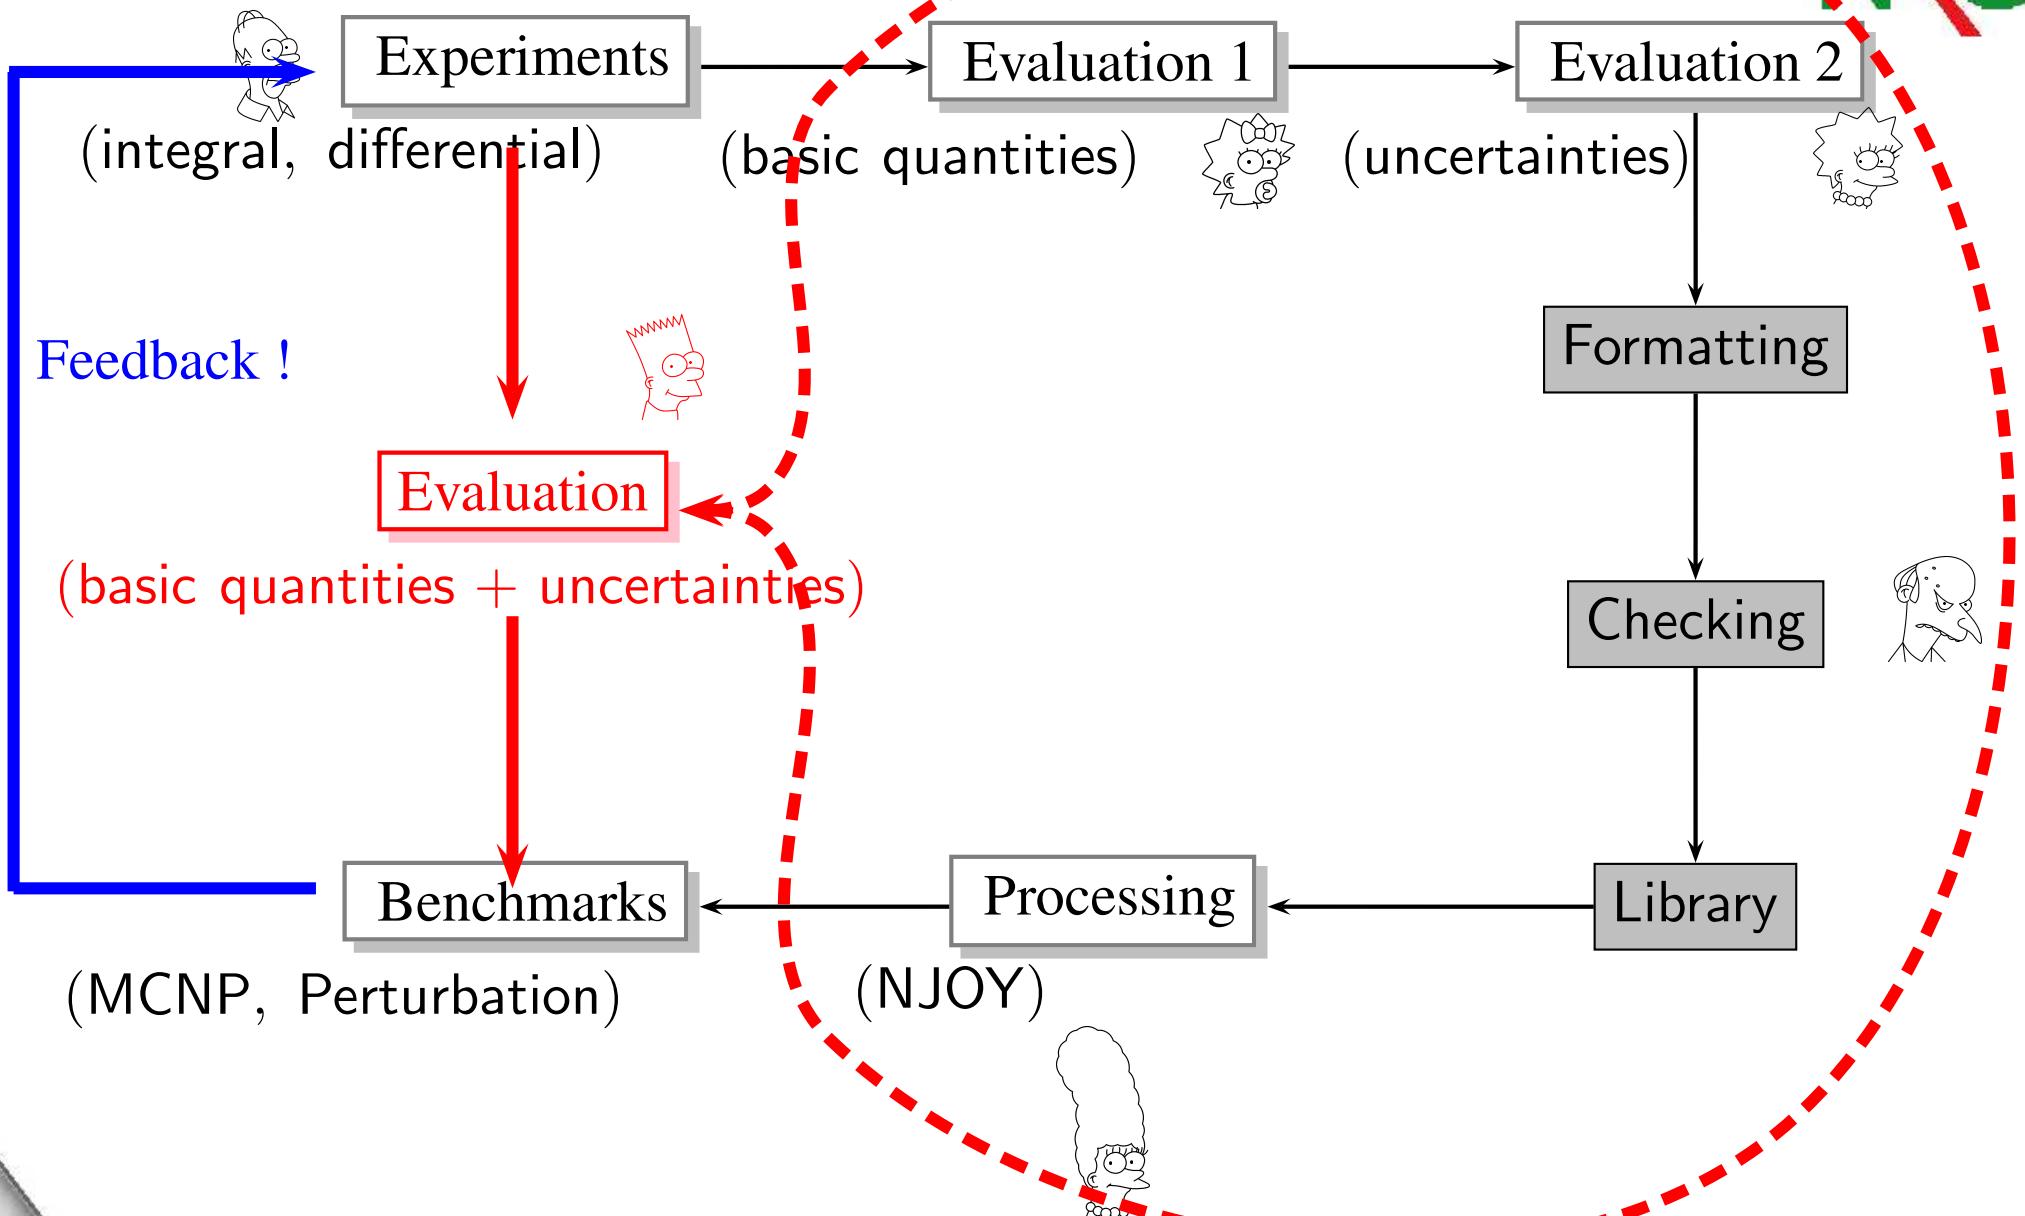

Concept: No more delocalization

Concept: No more delocalization

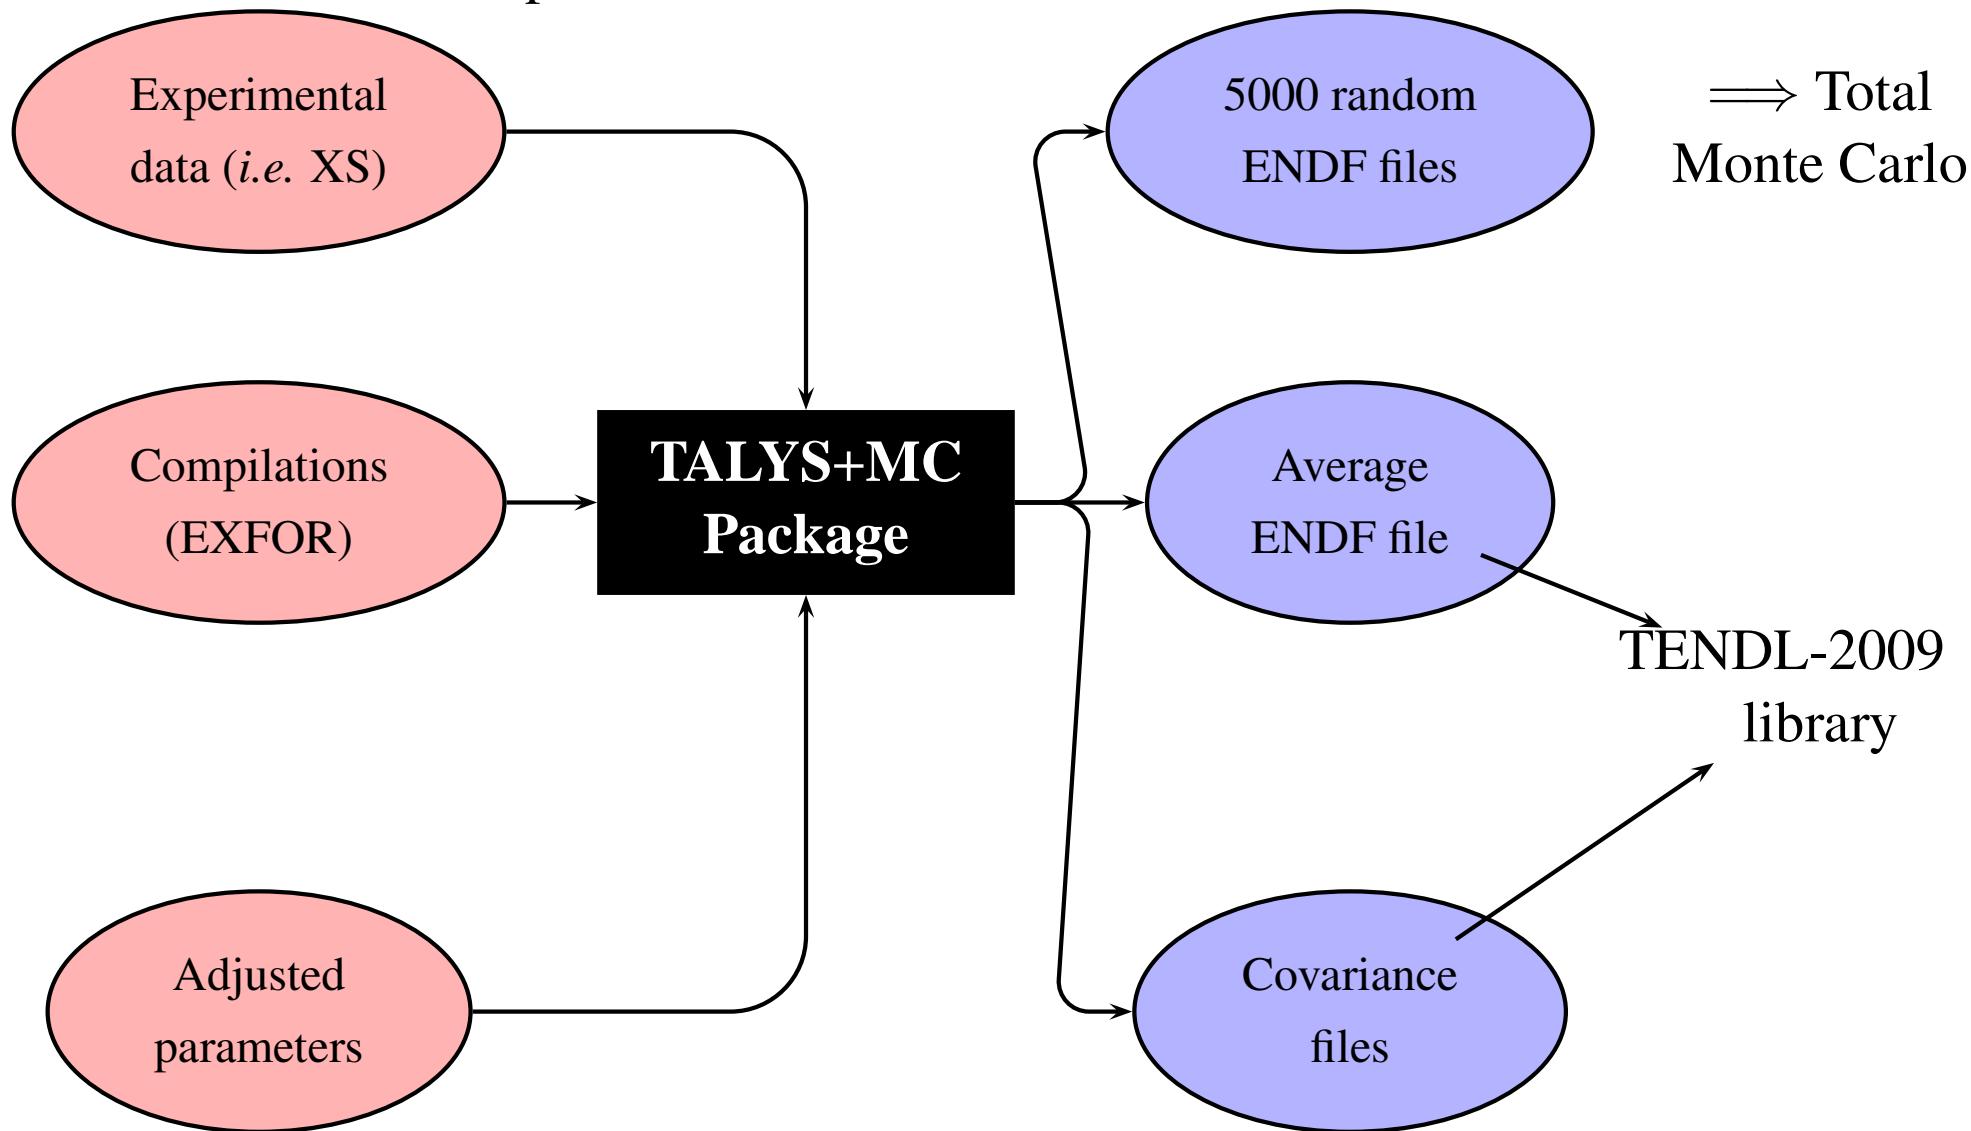

NRG

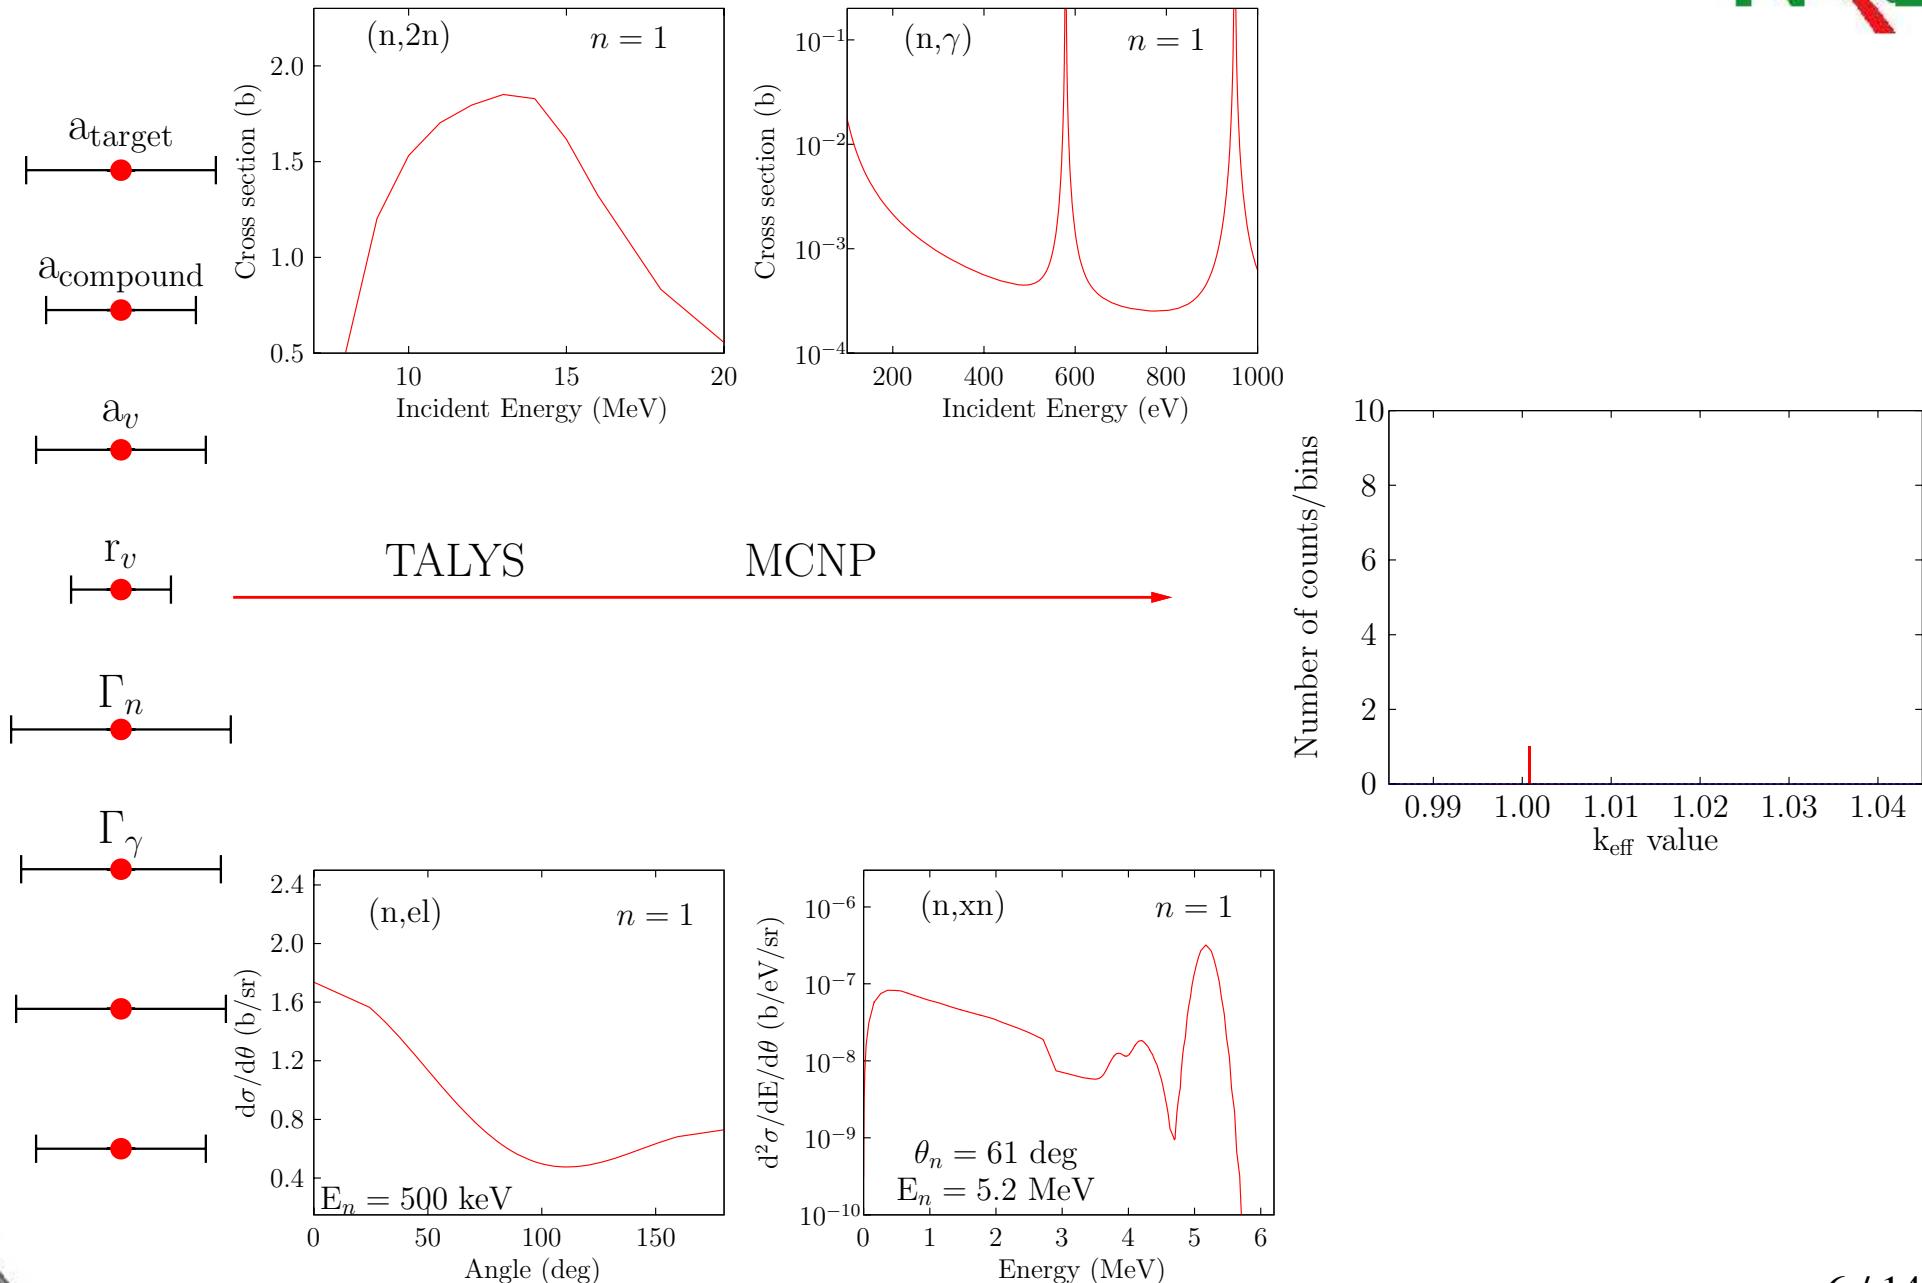

Concept: TALYS + Monte Carlo

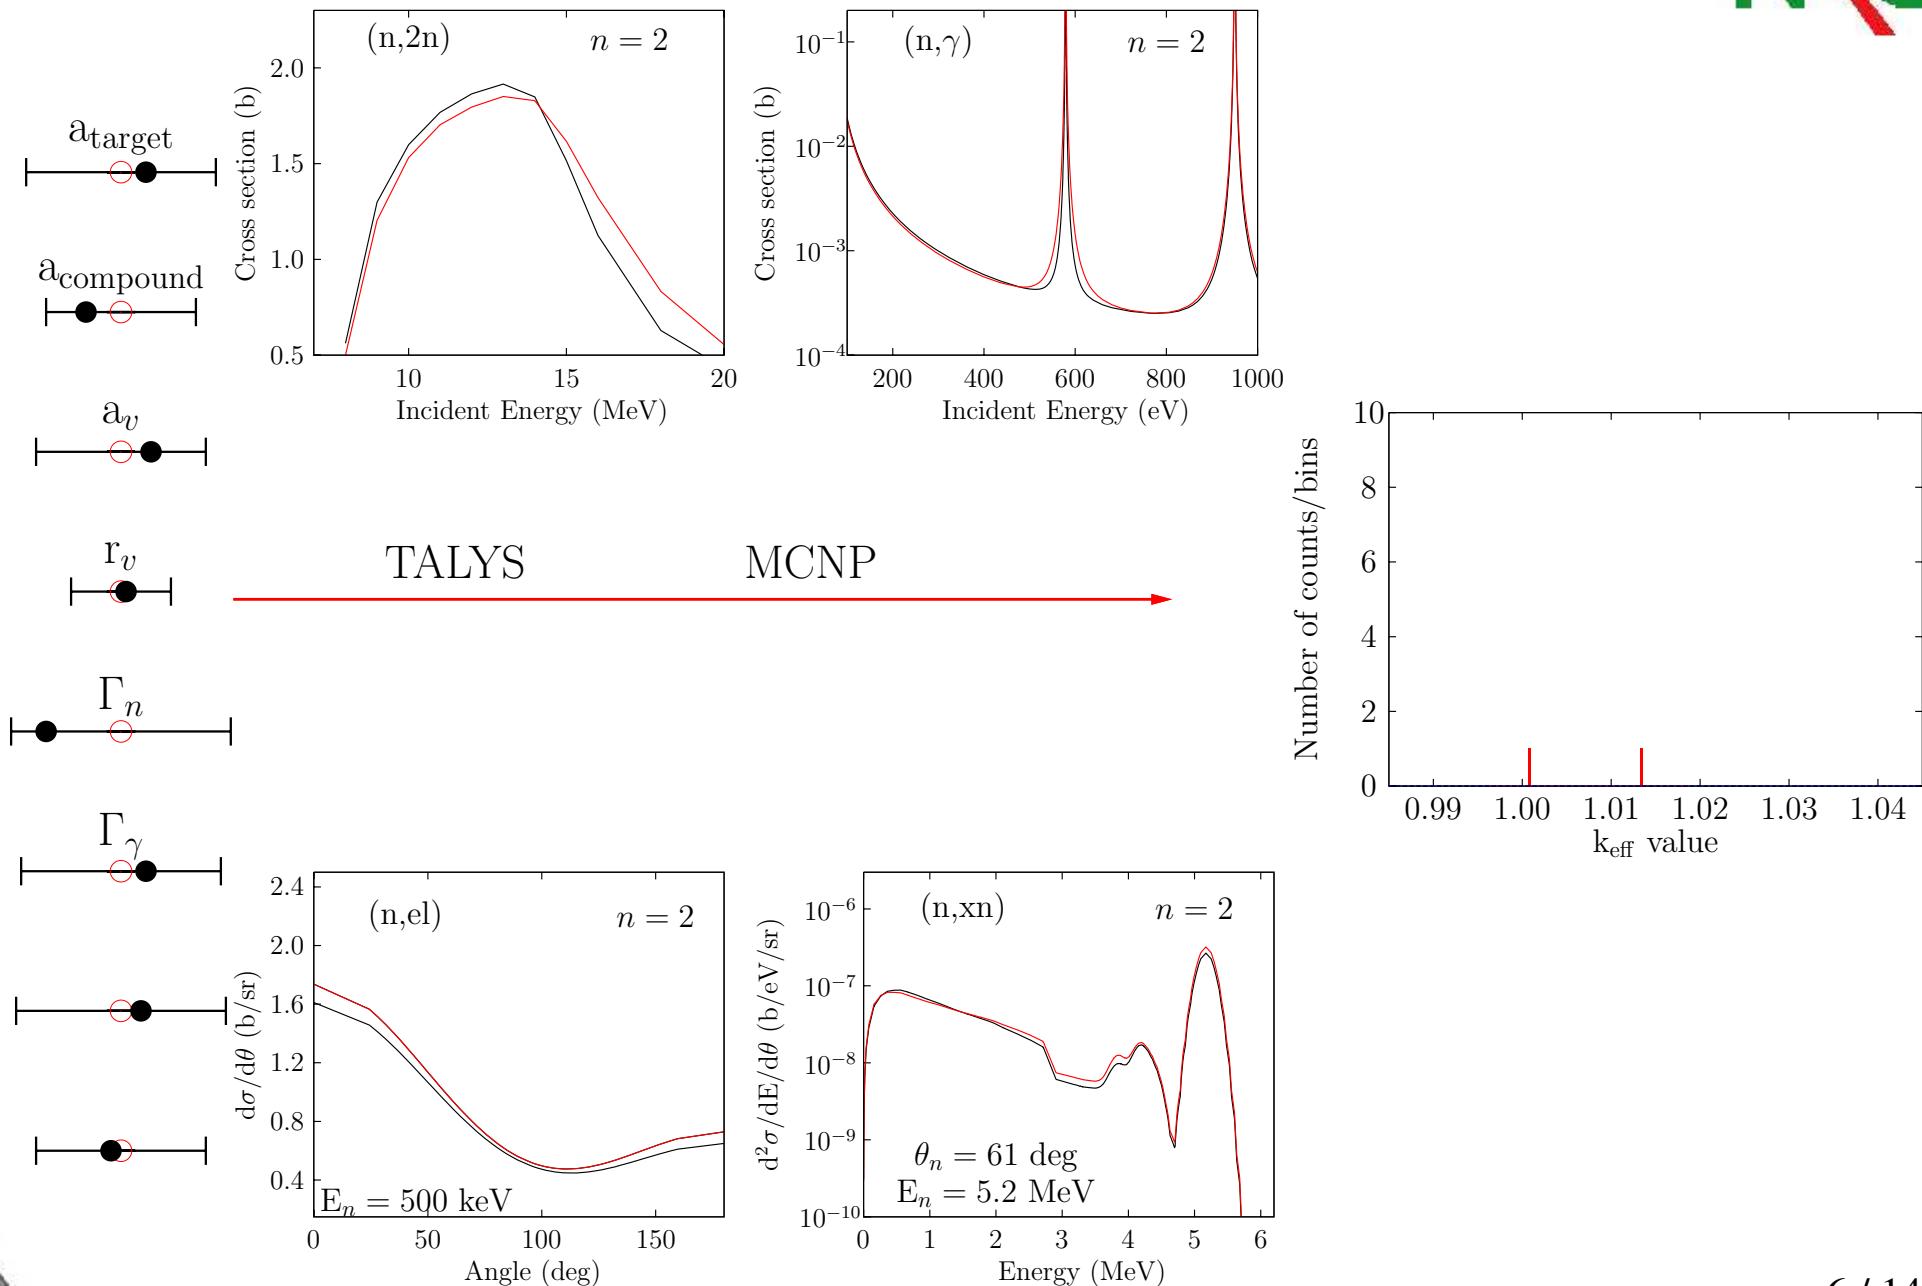

Possible answer to this problem: Maximization of automation

Statistical uncertainty $\simeq 68$ pcm

\Rightarrow uncertainty due to nuclear data $\simeq 740$ pcm

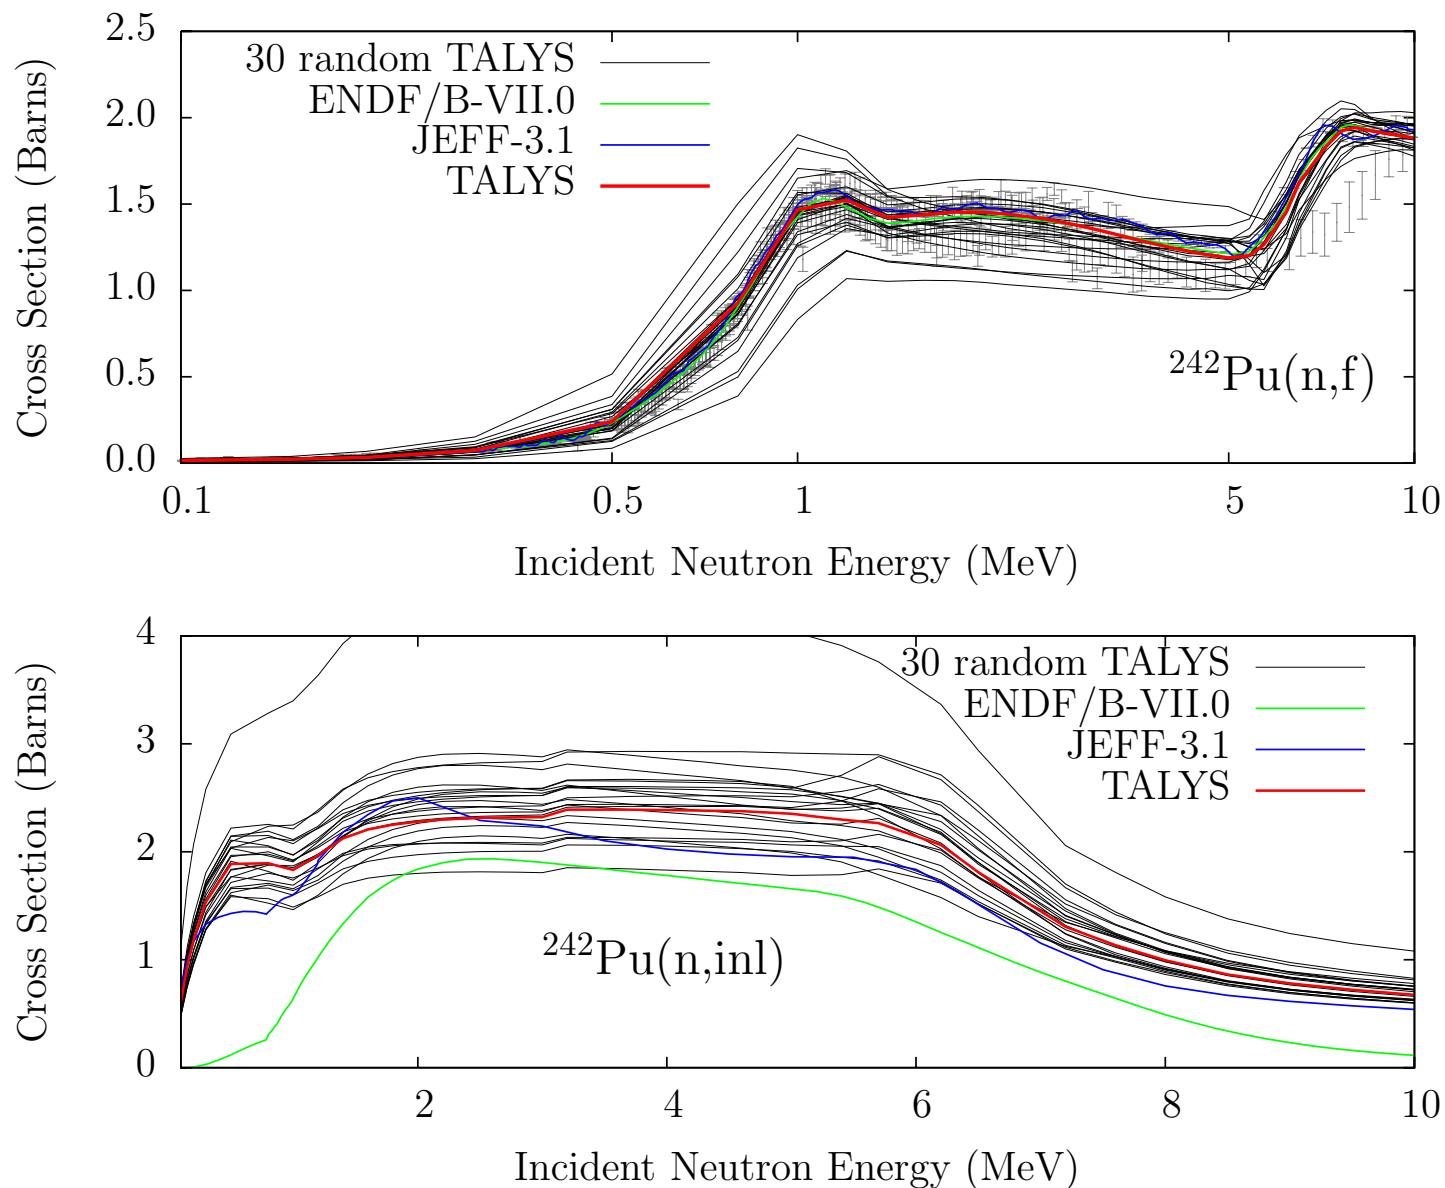

Example with ^{235}U : Monte Carlo calculations

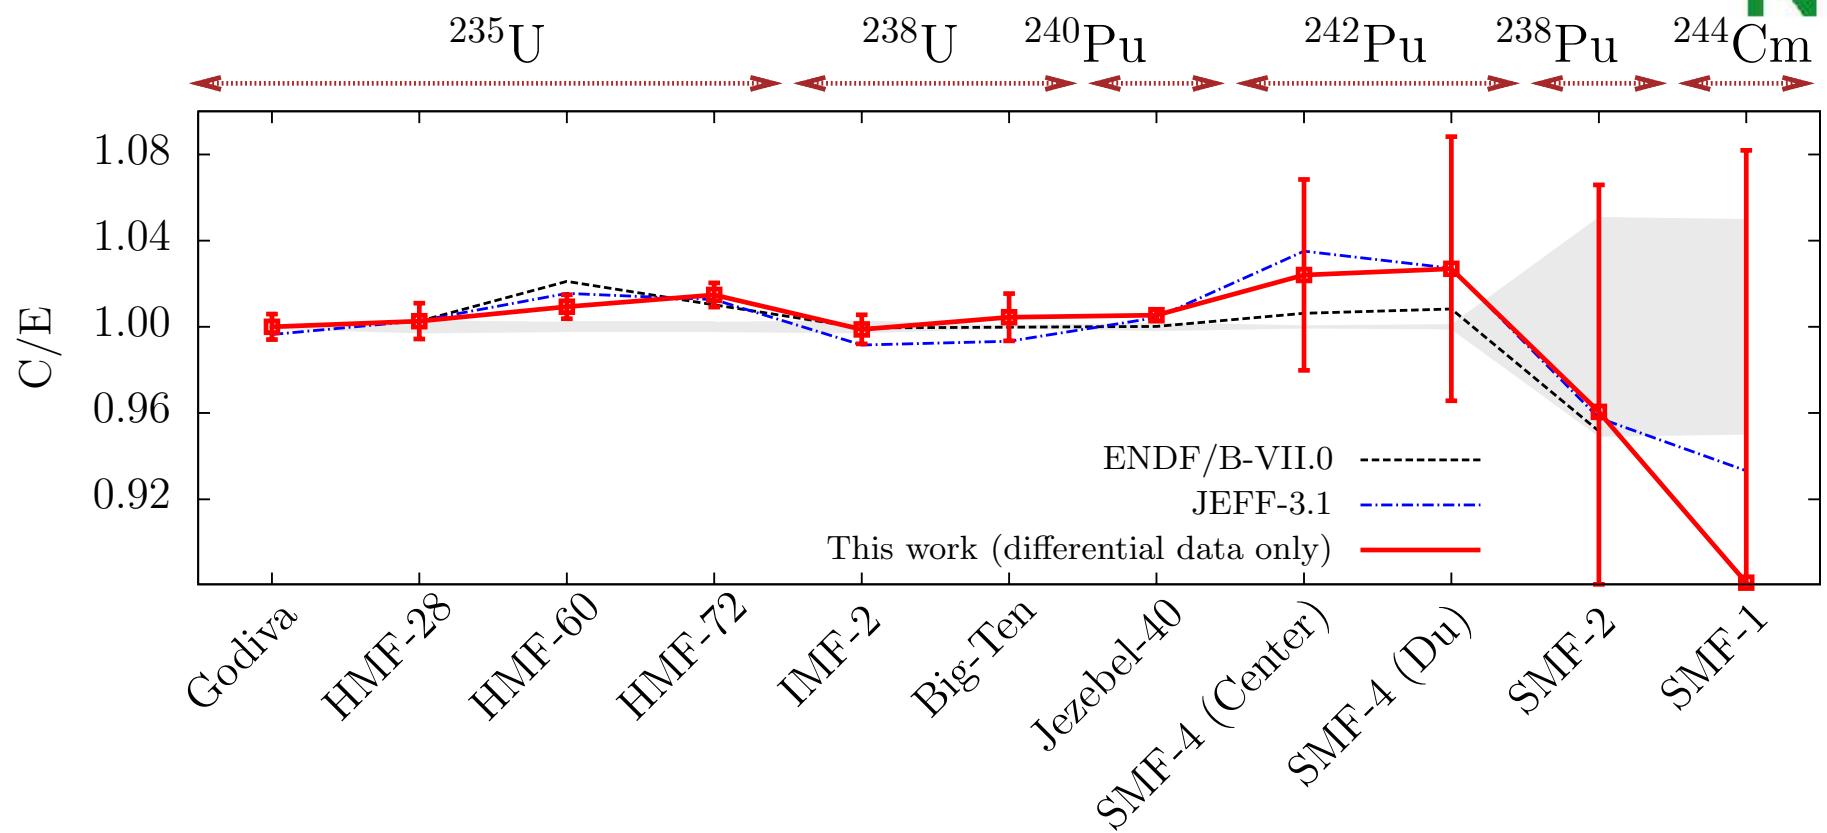

Example with ^{235}U : Monte Carlo calculations

Example with ^{242}Pu : Monte Carlo calculations

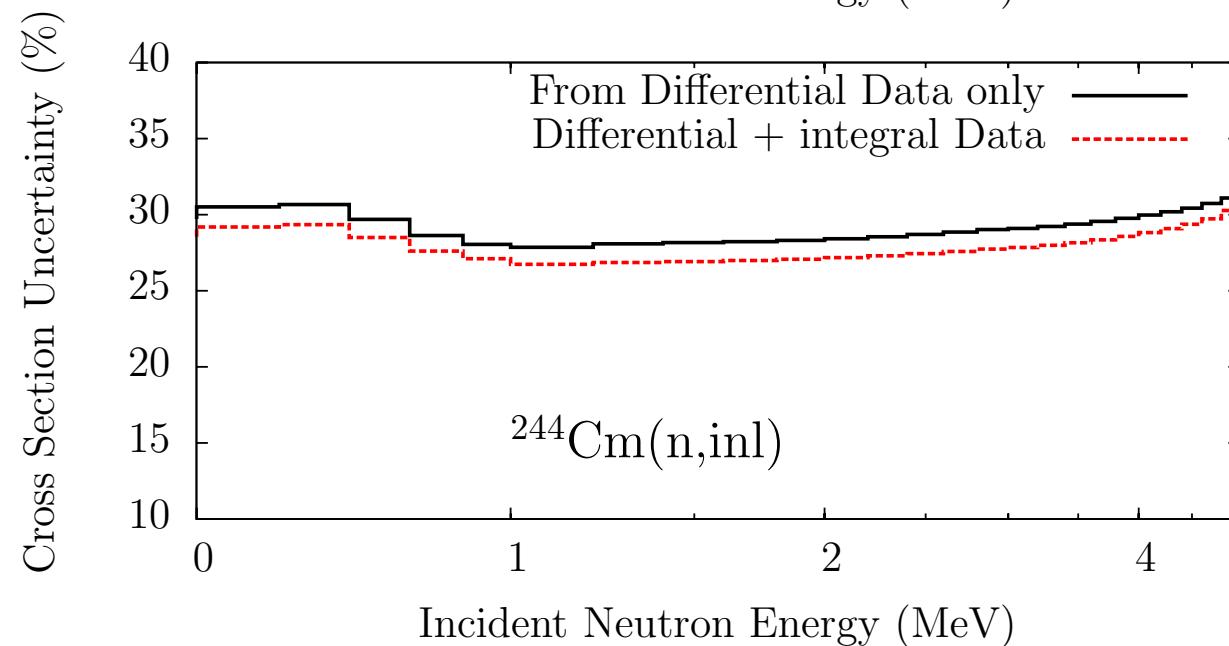

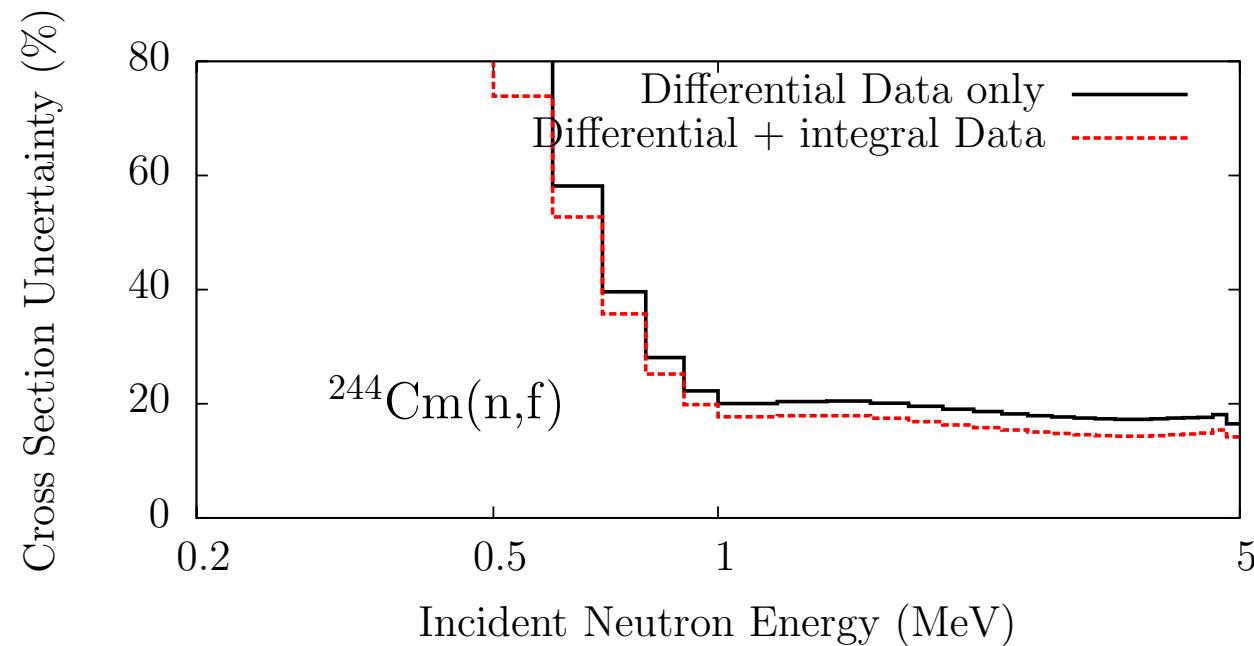

Benchmark results using differential data only

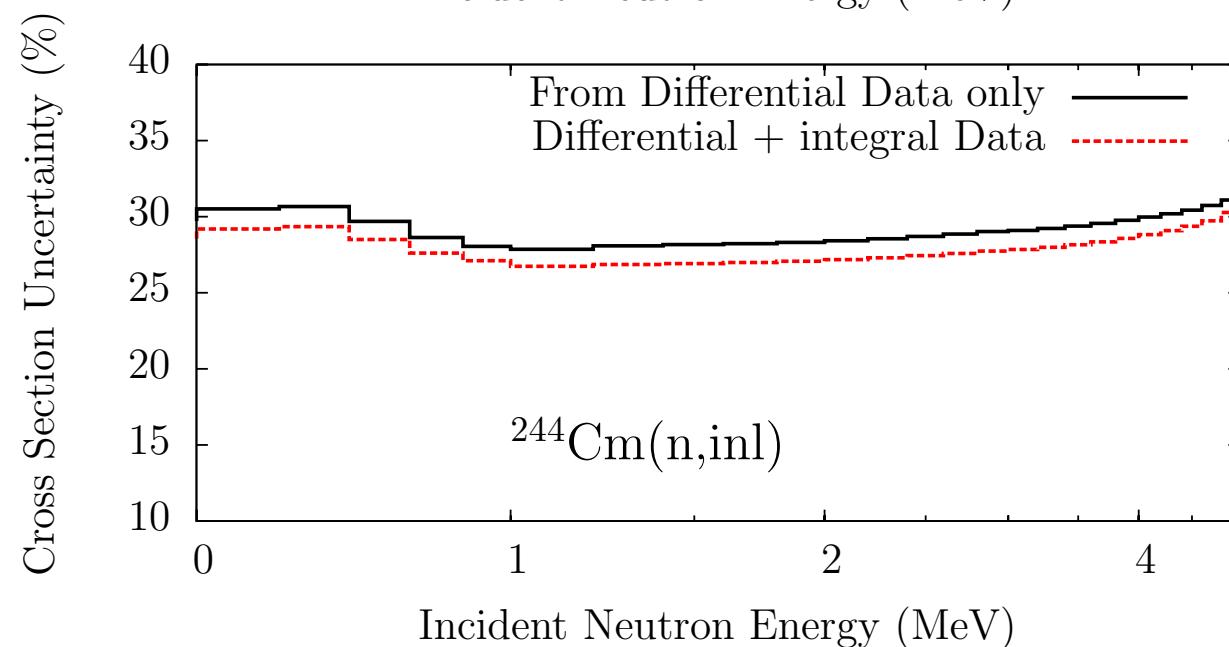

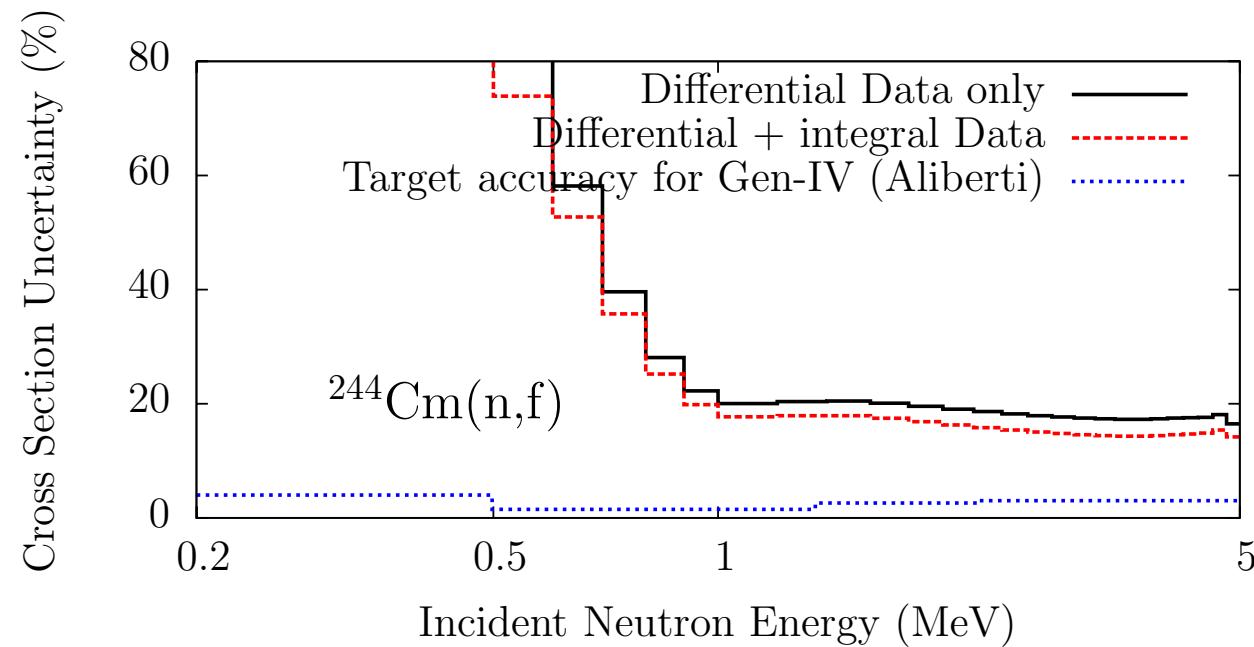

- Fast benchmarks
- SMF-1, -2 and -4: dedicated to minor actinides ($^{238,242}\text{Pu}$ and ^{244}Cm)
- SMF-1 and -2: Replacement measurements using Jezebel
- SMF-4: Plates of ^{242}Pu

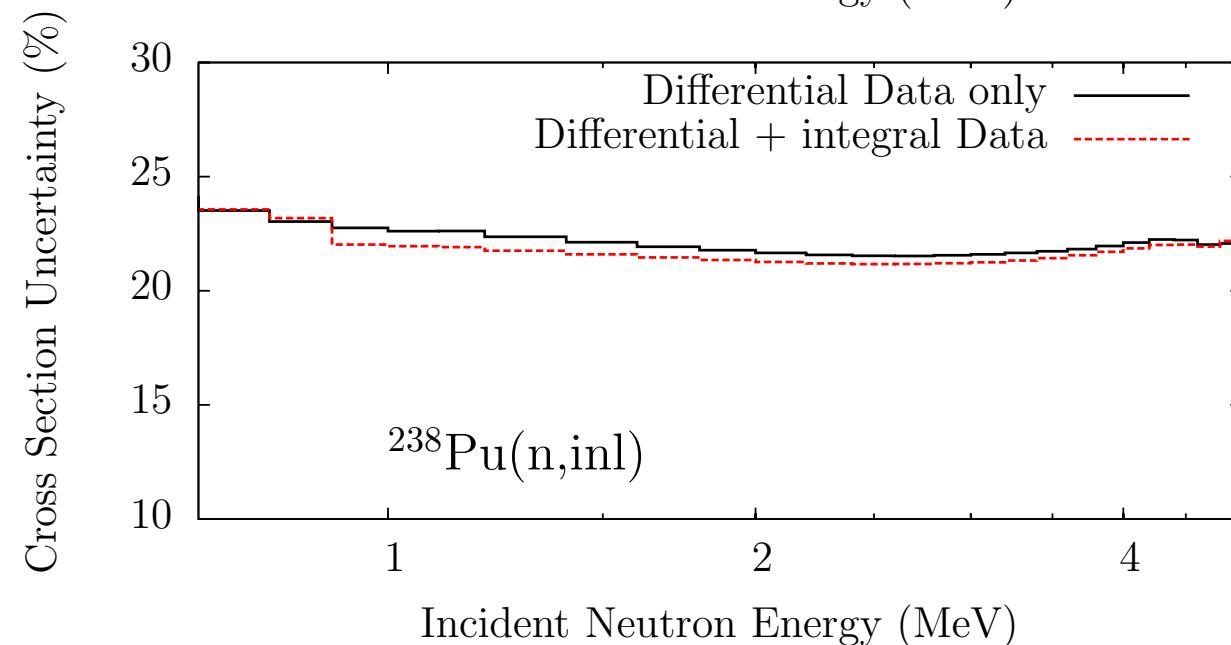

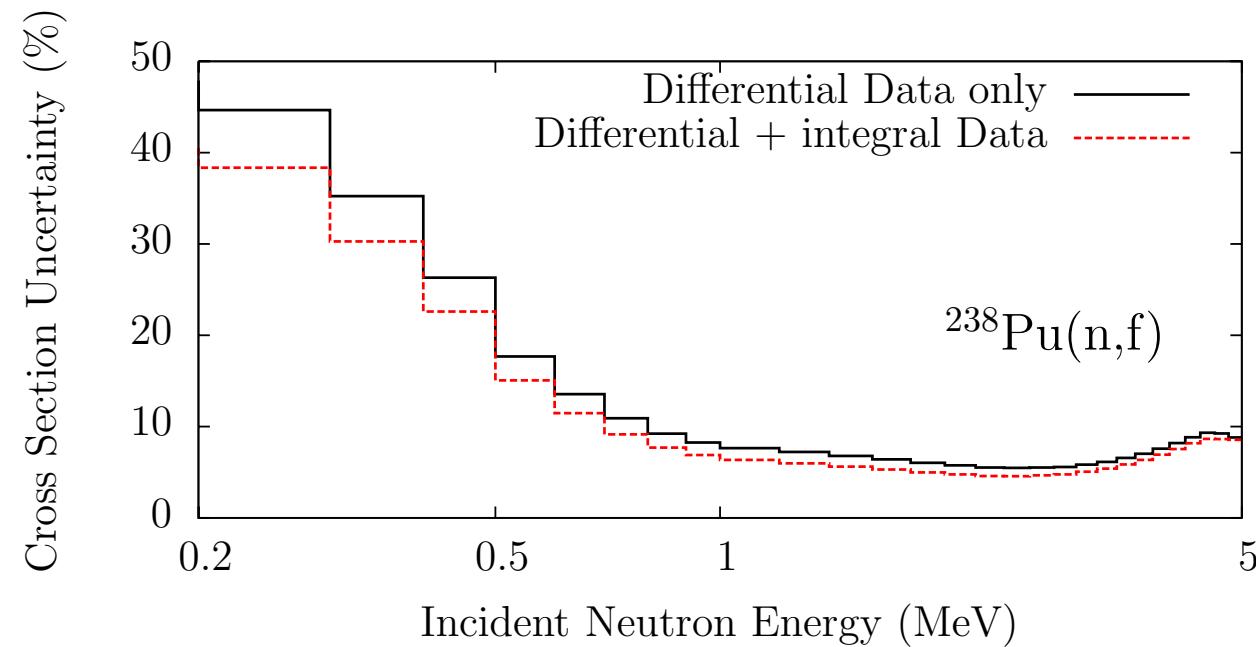

Impact on $^{244}\text{Cm}(n,f)$ and $^{244}\text{Cm}(n,\text{inl})$ uncertainties

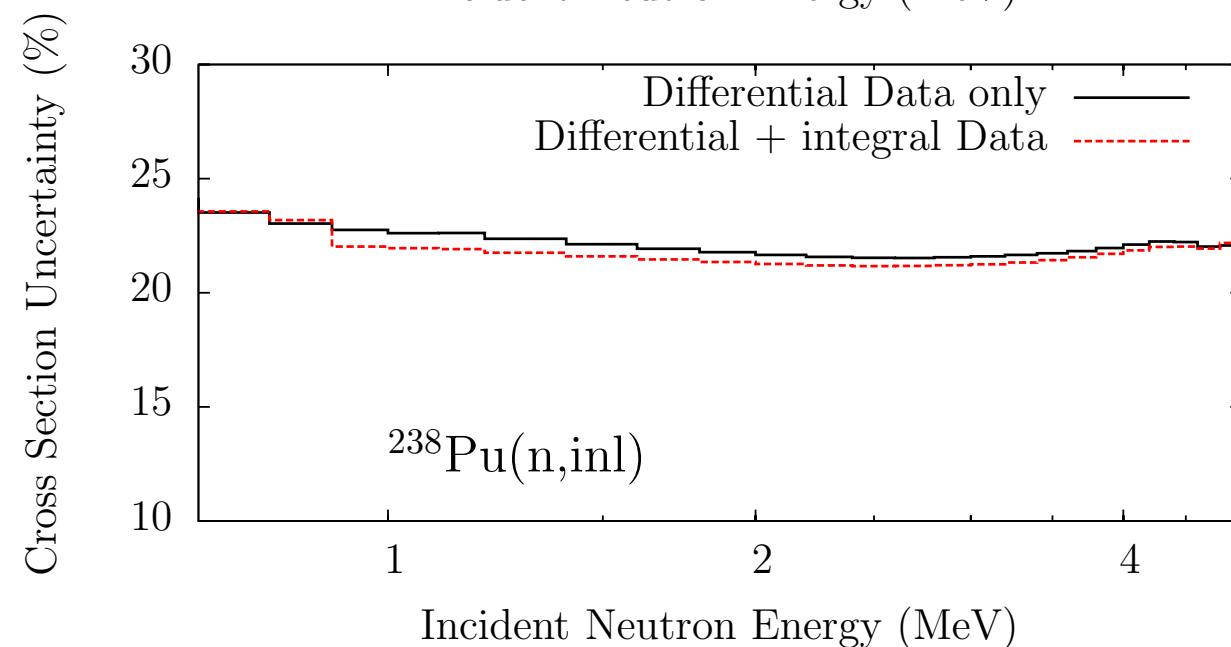

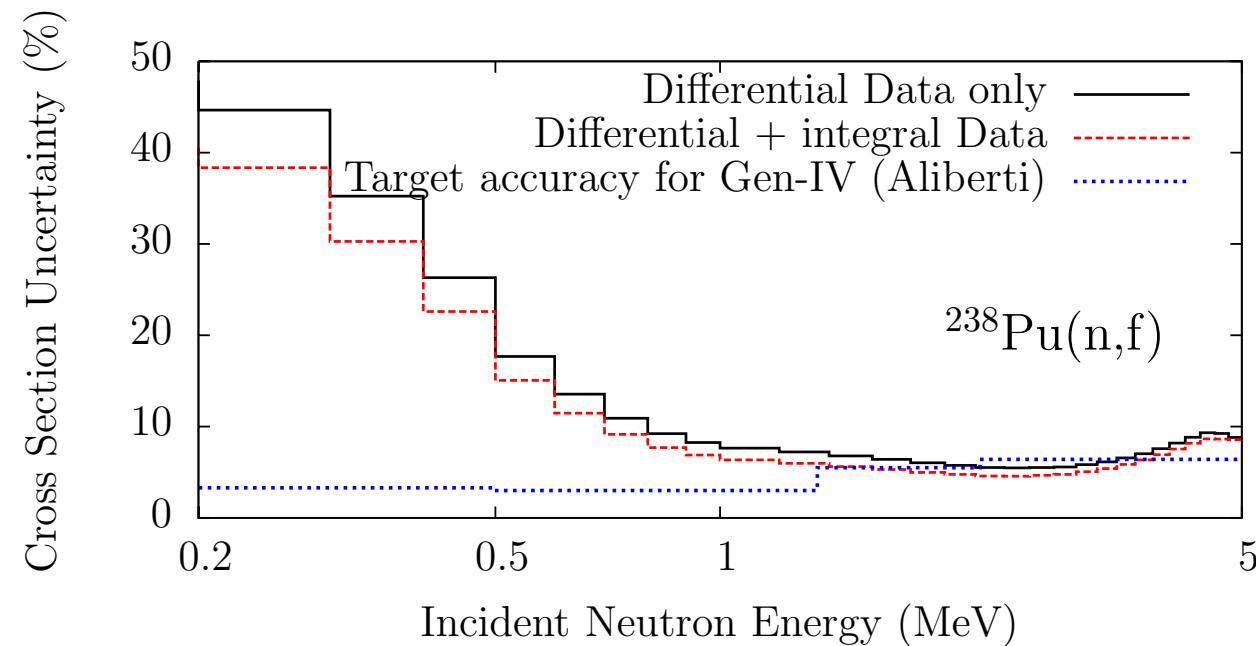

Impact on $^{244}\text{Cm}(n,f)$ and $^{244}\text{Cm}(n,\text{inl})$ uncertainties

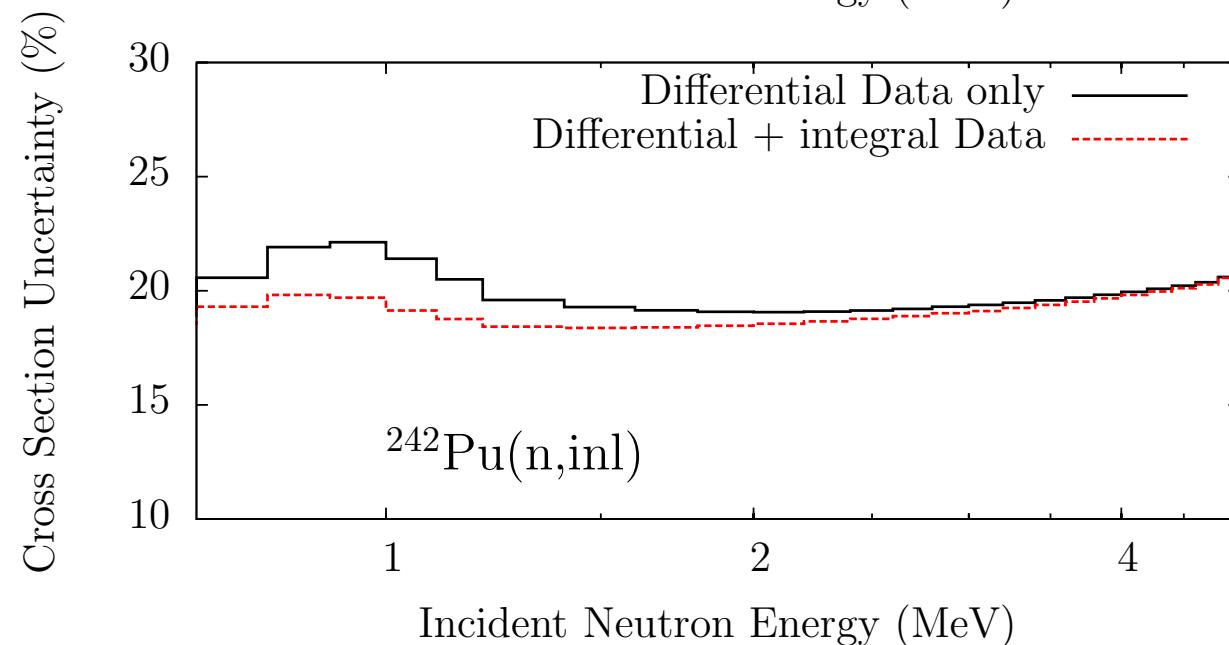

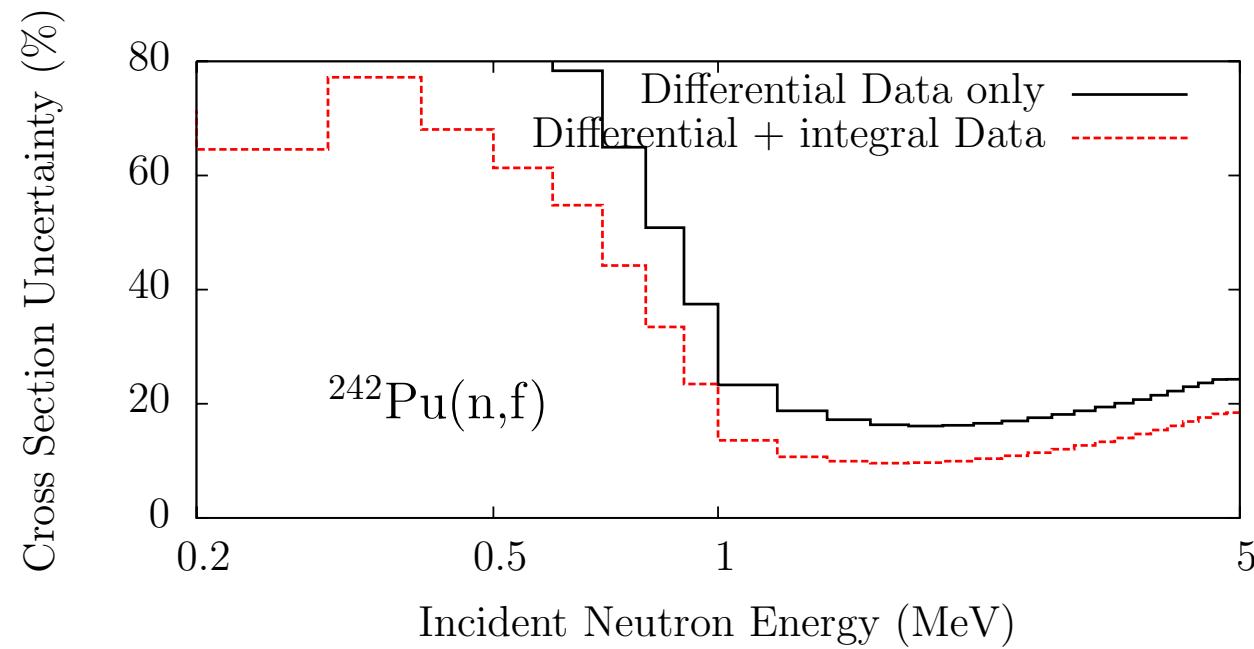

Impact on $^{238}\text{Pu}(n,f)$ and $^{238}\text{Pu}(n,\text{inl})$ uncertainties

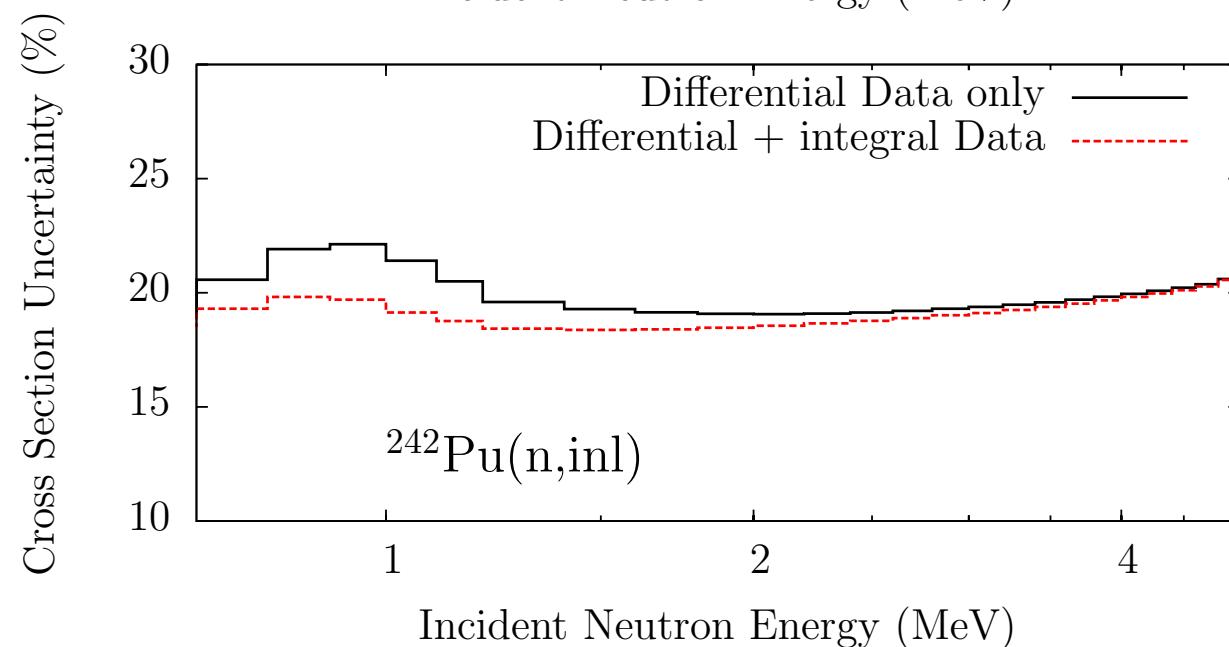

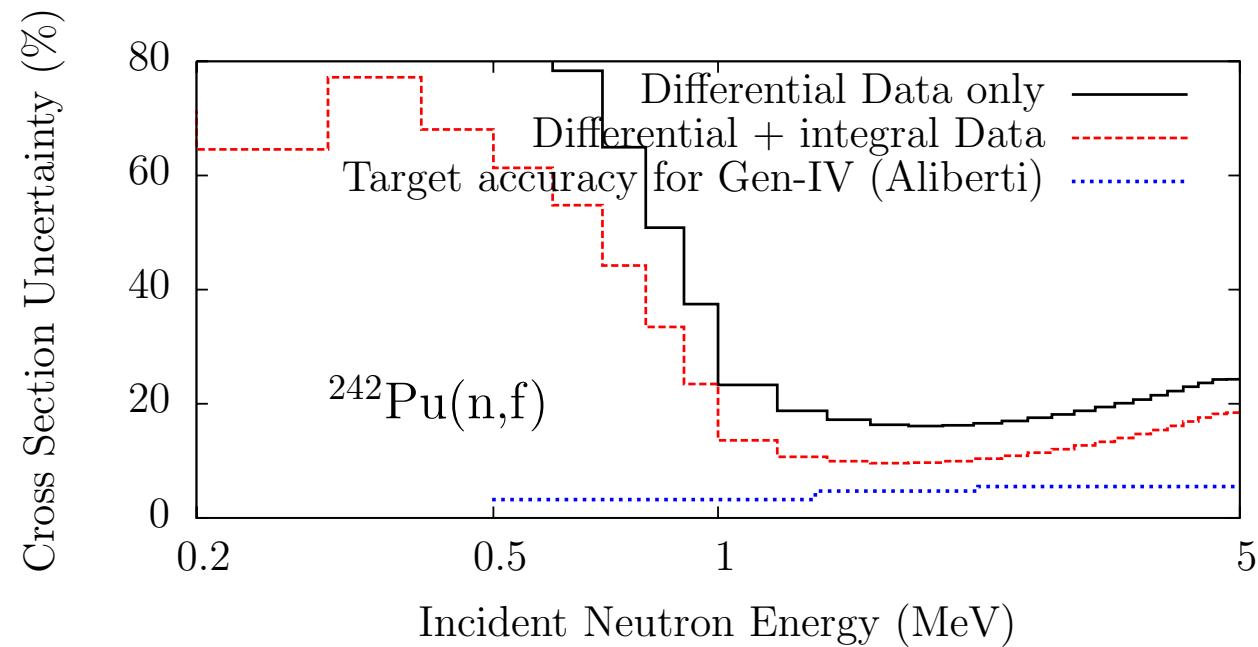

Impact on $^{238}\text{Pu}(n,f)$ and $^{238}\text{Pu}(n,\text{inl})$ uncertainties

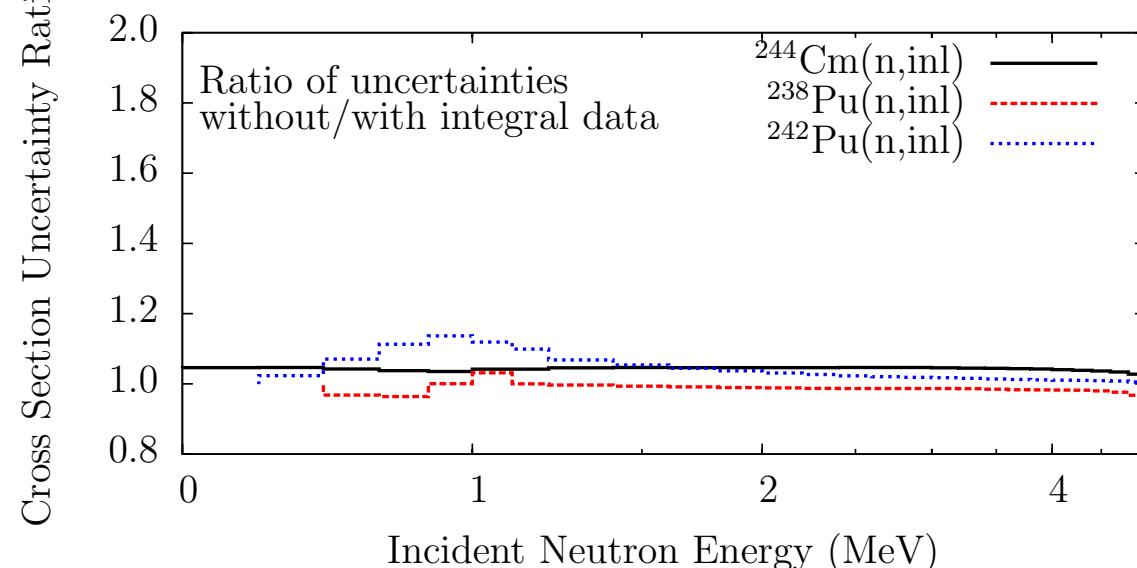

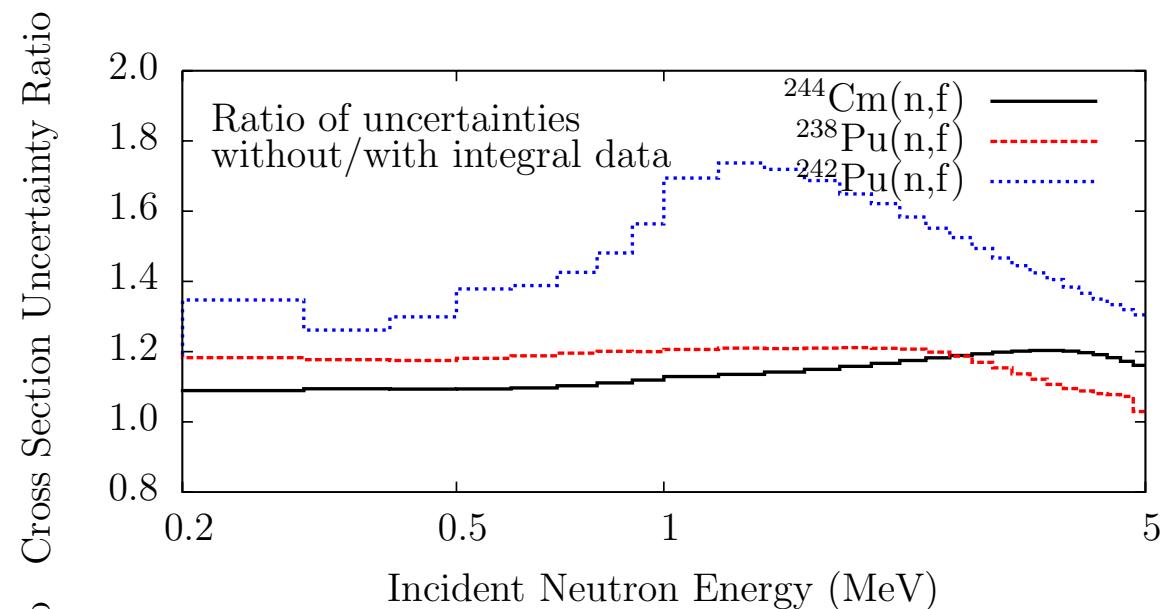

Impact on $^{242}\text{Pu}(\text{n,f})$ and $^{242}\text{Pu}(\text{n,inl})$ uncertainties

Impact on $^{242}\text{Pu}(\text{n,f})$ and $^{242}\text{Pu}(\text{n,inl})$ uncertainties

Summary of the impact

Conclusions and future improvements

- ☒ New methodology to propagate nuclear data uncertainty to integral quantities (k_{eff} benchmarks, shielding benchmarks, reactivity swing, neutron flux for commercial reactor) via Monte Carlo
- ☒ Blending differential measurements, evaluations, and validation in one approach
- ☒ Proof of principle with minor actinides (and other isotopes)
- ☒ Mass production tested (new library TENDL-2008 and TENDL-2009 (see JEFF meeting in June))

Conclusions and future improvements

- ☒ New methodology to propagate nuclear data uncertainty to integral quantities (k_{eff} benchmarks, shielding benchmarks, reactivity swing, neutron flux for commercial reactor) via Monte Carlo
- ☒ Blending differential measurements, evaluations, and validation in one approach
- ☒ Proof of principle with minor actinides (and other isotopes)
- ☒ Mass production tested (new library TENDL-2008 and TENDL-2009 (see JEFF meeting in June))
- Needs to develop best central-value evaluations (non-fissile and fissile) ?
- Compare with more benchmarks and more reaction channels (e.g. (n,γ))
- Need more clever sampling,
- At the end, experimentalists can tell about the feasibility of reaching smaller uncertainties.
