Contents

① Goals:

\implies *Uncertainties on an SFR parameters*

② Concept for uncertainty propagation:

\implies *Total Monte Carlo and Perturbation methods*

③ SFR Model:

\implies *Kalimer-600 and MCNP*

④ Nuclear Data:

\implies $^{235,238}U$, $^{239,240}Pu$, ^{23}Na , ^{56}Fe , ^{90}Zr

⑤ Results:

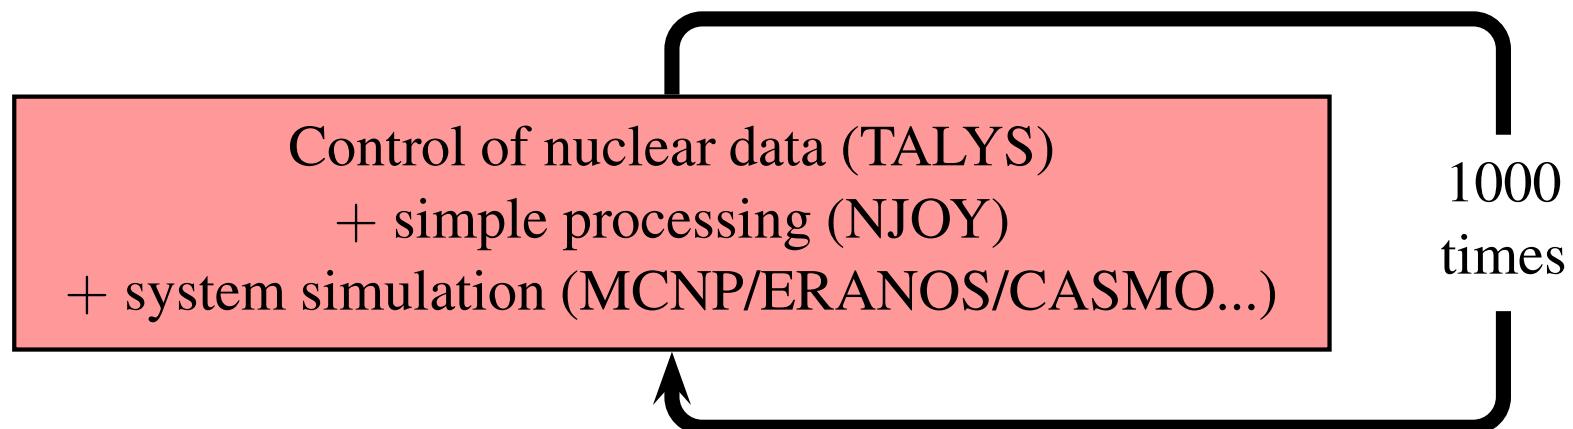

\implies *Void coefficient and k_{eff}*

⑥ Conclusions and Future Studies

Goals:

- ① Obtain uncertainties on an SFR model due to nuclear data uncertainties
- ② Systematic approach, reliable and reproducible

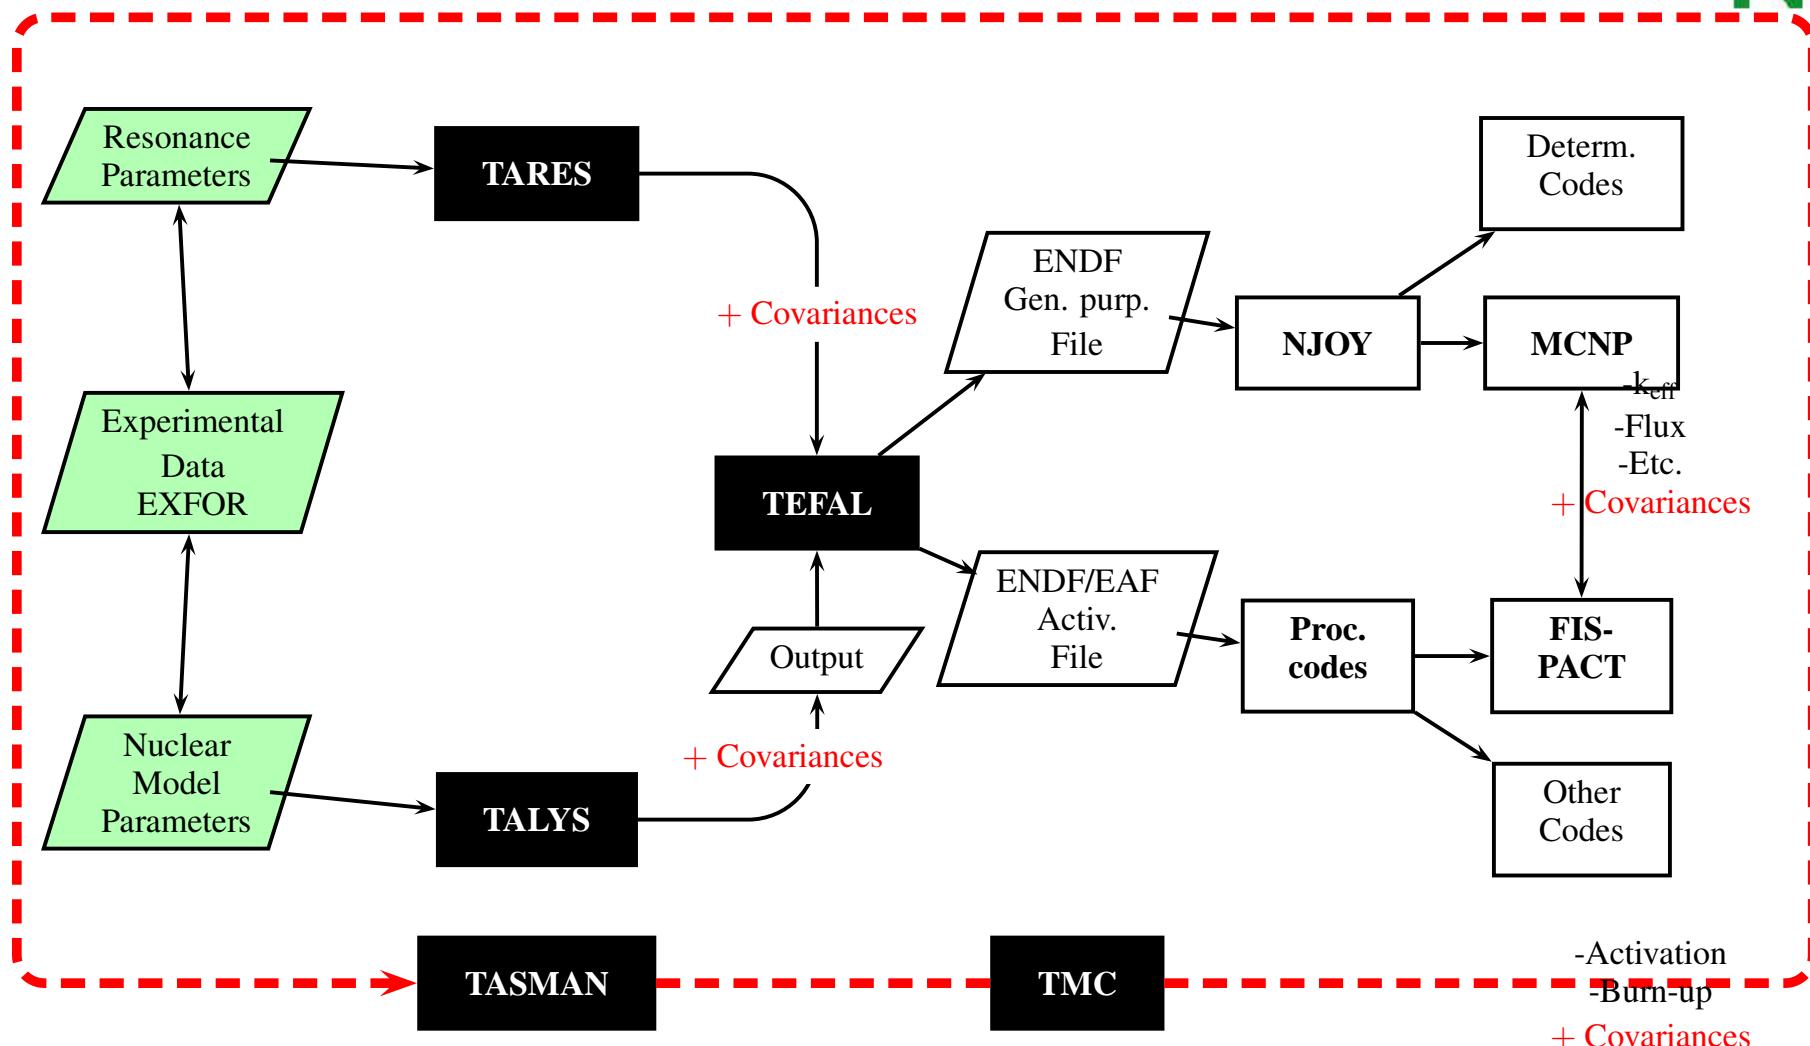

Solution (1): Total Monte Carlo

Solution (2): Perturbation method

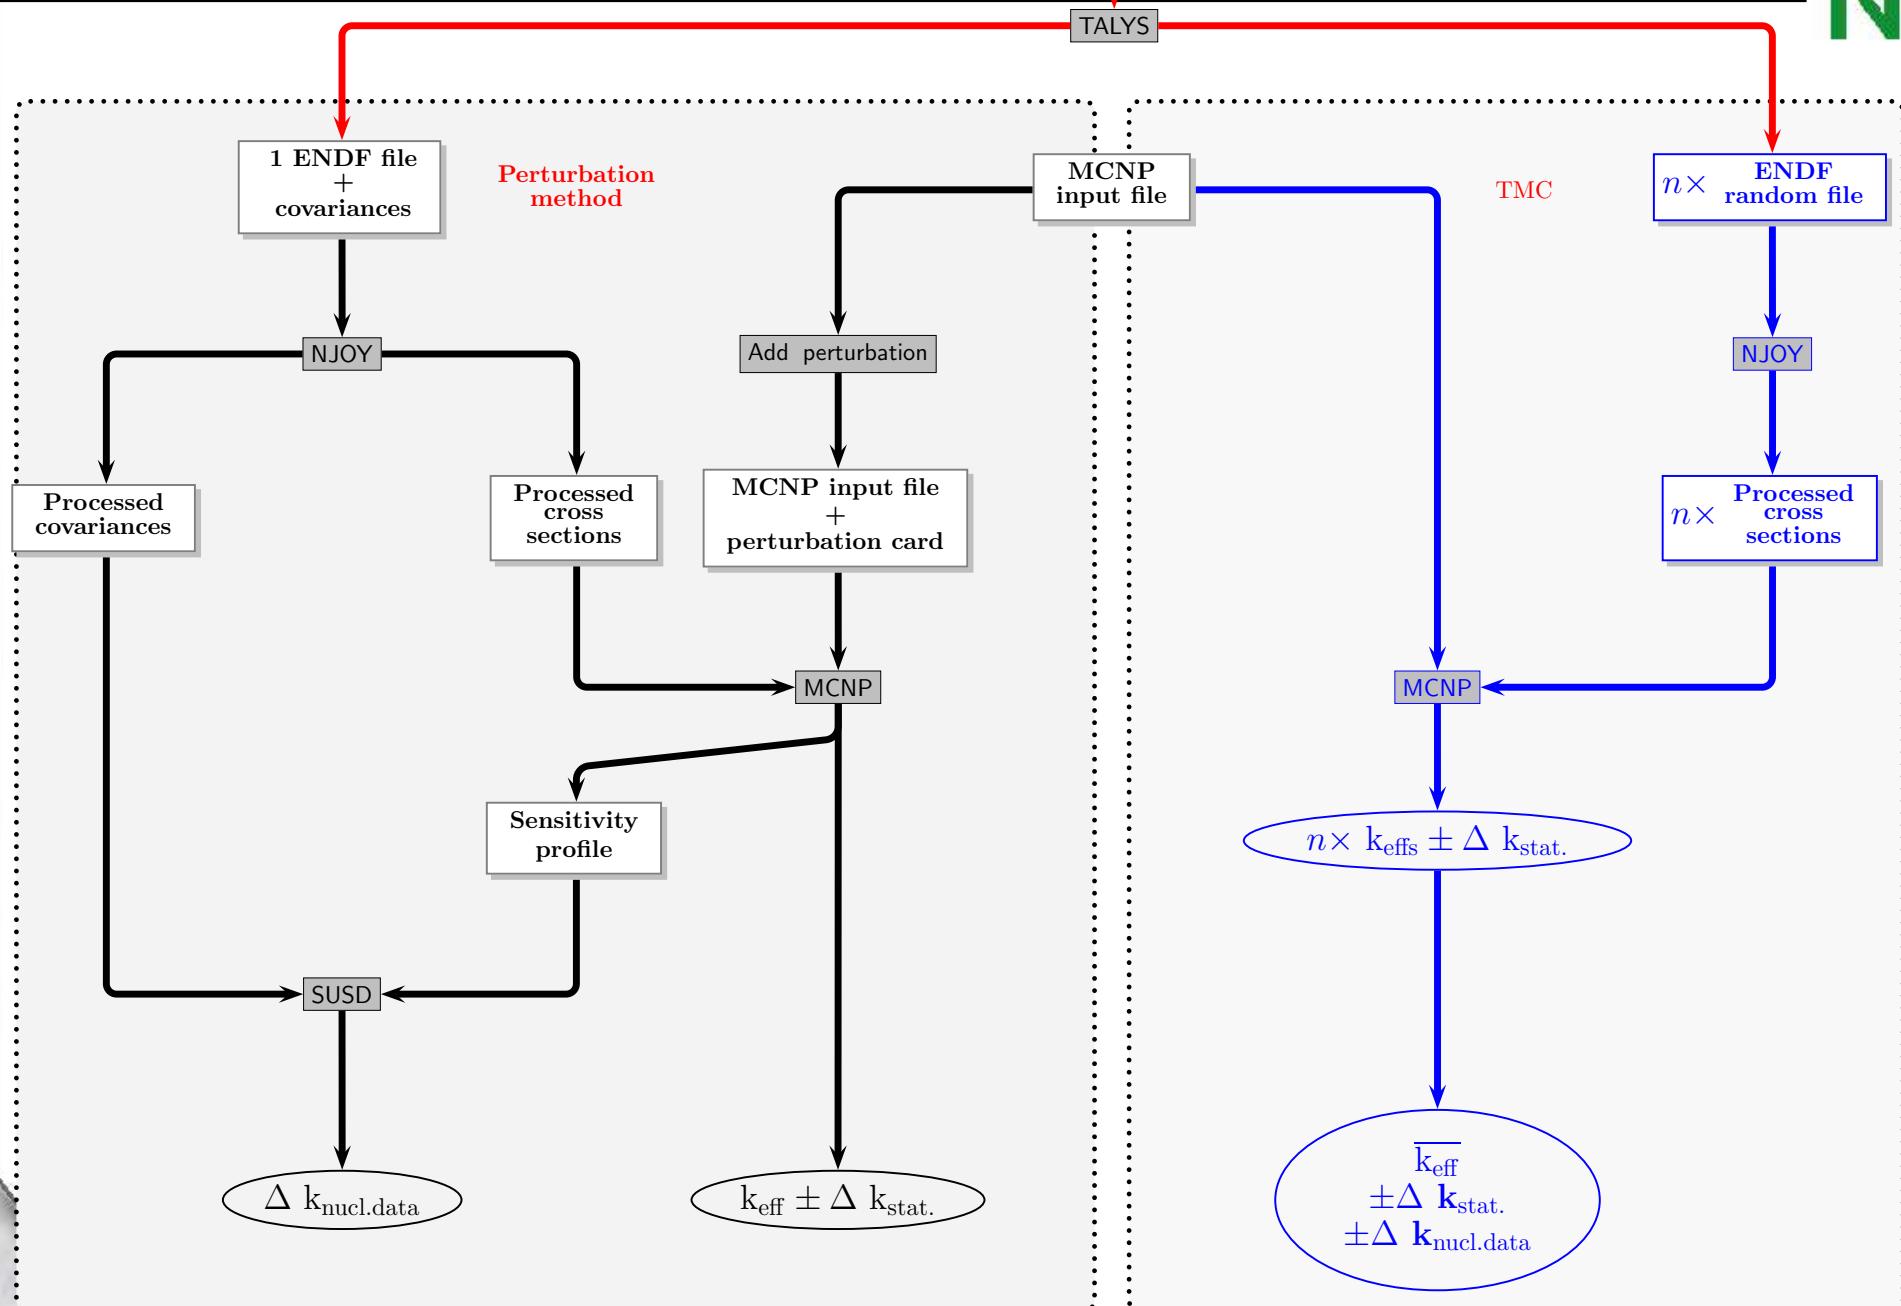

⇒ MCNP + Perturbation cards

Concept: TALYS + Monte Carlo = Total Monte Carlo

Monte Carlo: 1000 runs of all codes

TMC and Perturbation method

Kalimer model and MCNP

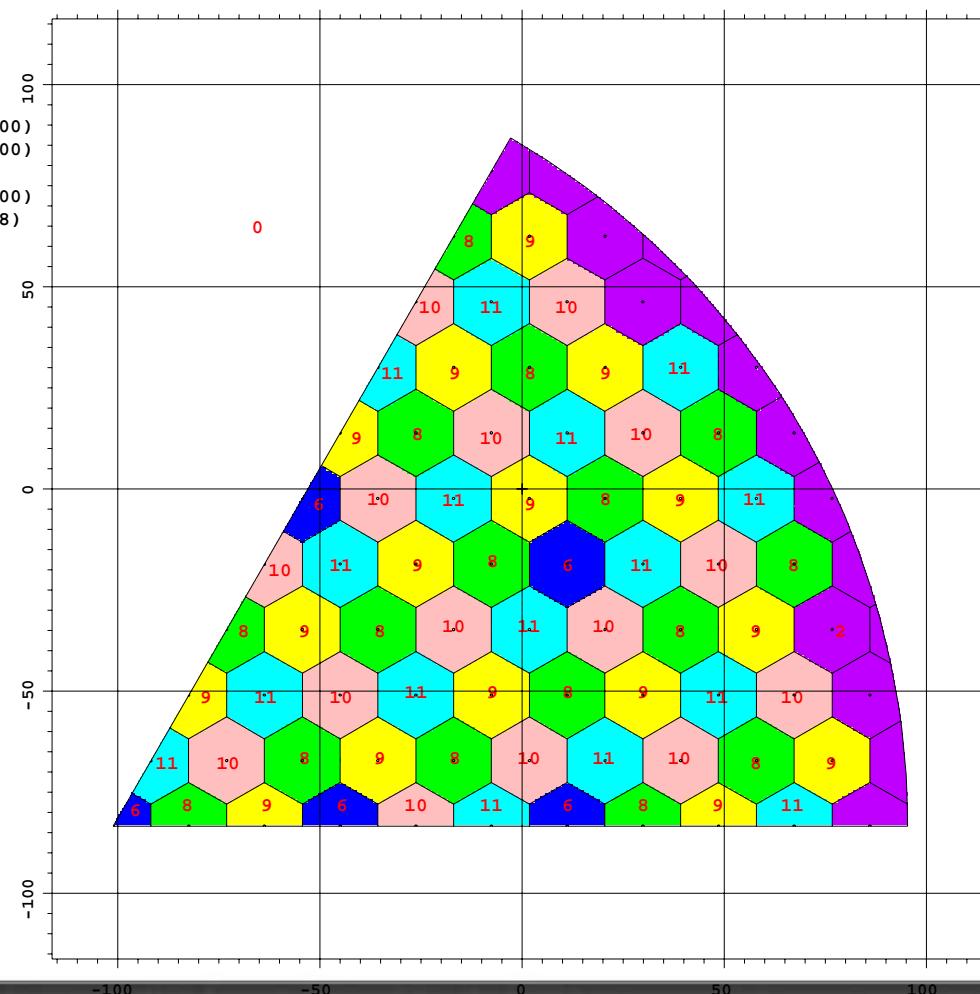

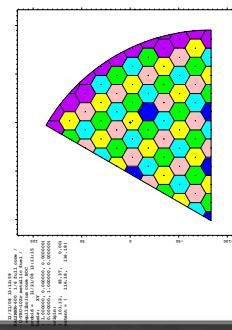

Simplified full core model of the Kalimer-600 (one single fuel zone for fresh fuel) & Equilibrium reactor core with 4-batches,

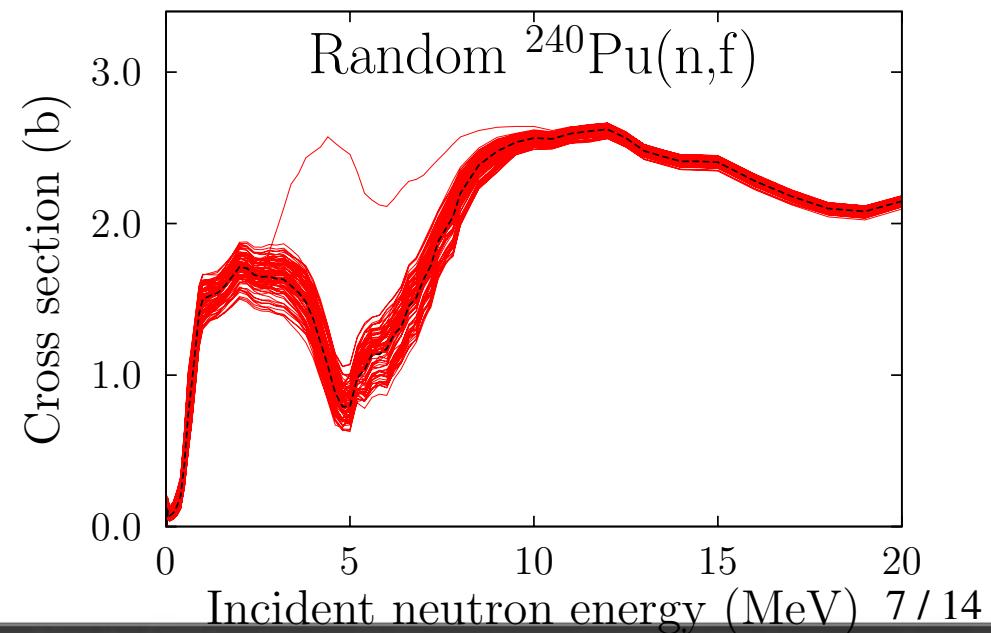

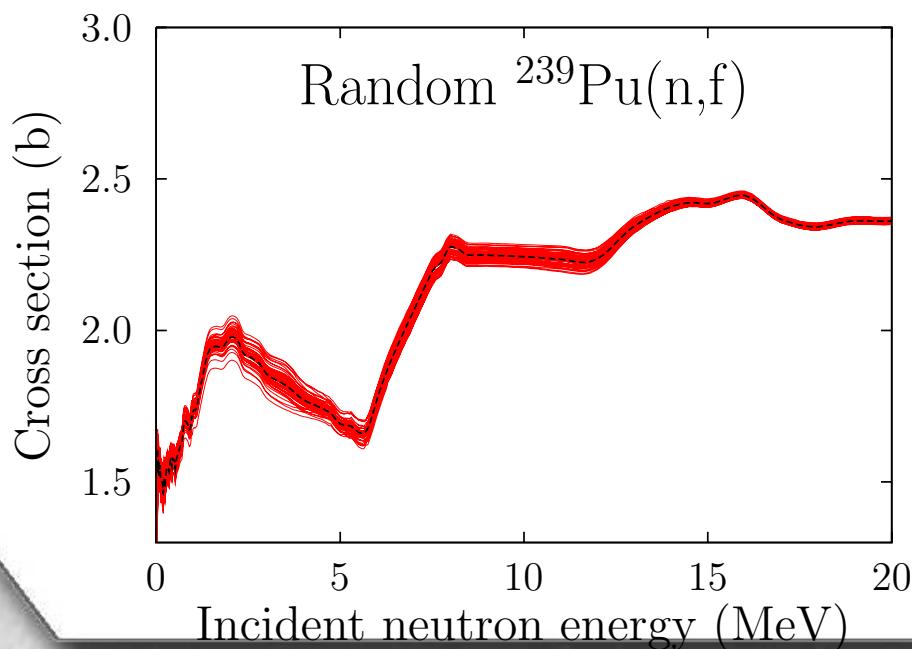

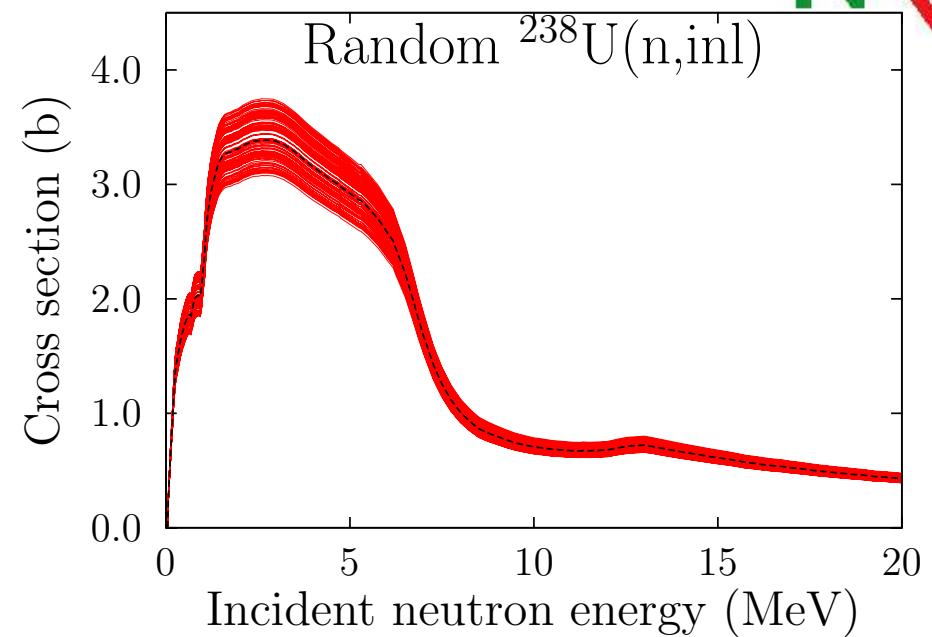

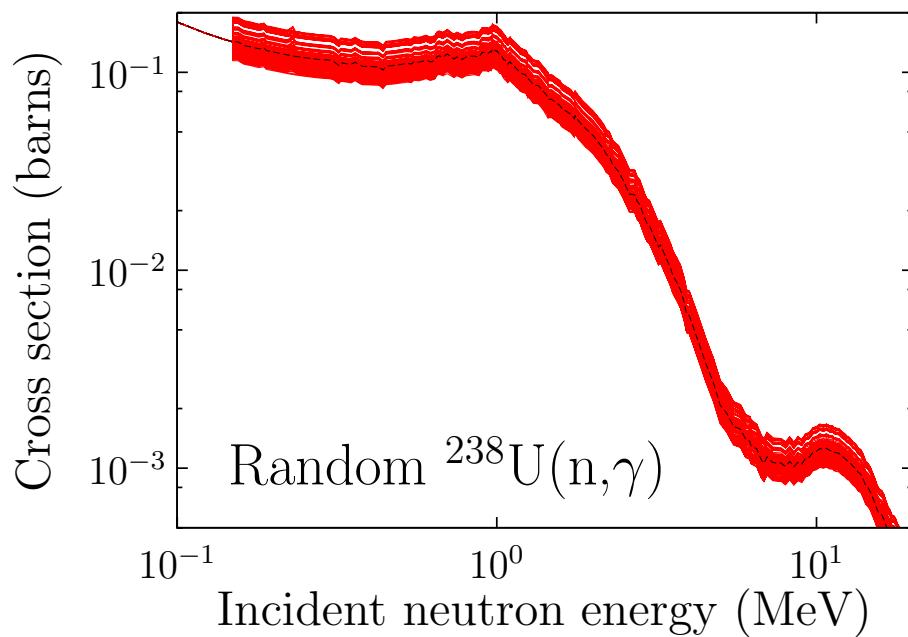

Fuel type: metal alloy U-TRU-10 %Zr, isotopic vector provided by KAERI.

^{238}U : 83 %, ^{239}Pu : 10 %, ^{240}Pu : 5 %, ^{241}Pu : 1 %

```
11/21/08 13:12:47
KALIMER-600 1/6 full core /
U-TRU-10Zr metallic fuel /
equilibrium core BOC
probid = 11/21/08 13:11:15
basis: XY
( 1.000000, 0.000000, 0.000000)
( 0.000000, 1.000000, 0.000000)
origin:
( -101.12, 83.37, 0.00)
extent = ( 116.18, 116.18)
cell labels are
material numbers
```

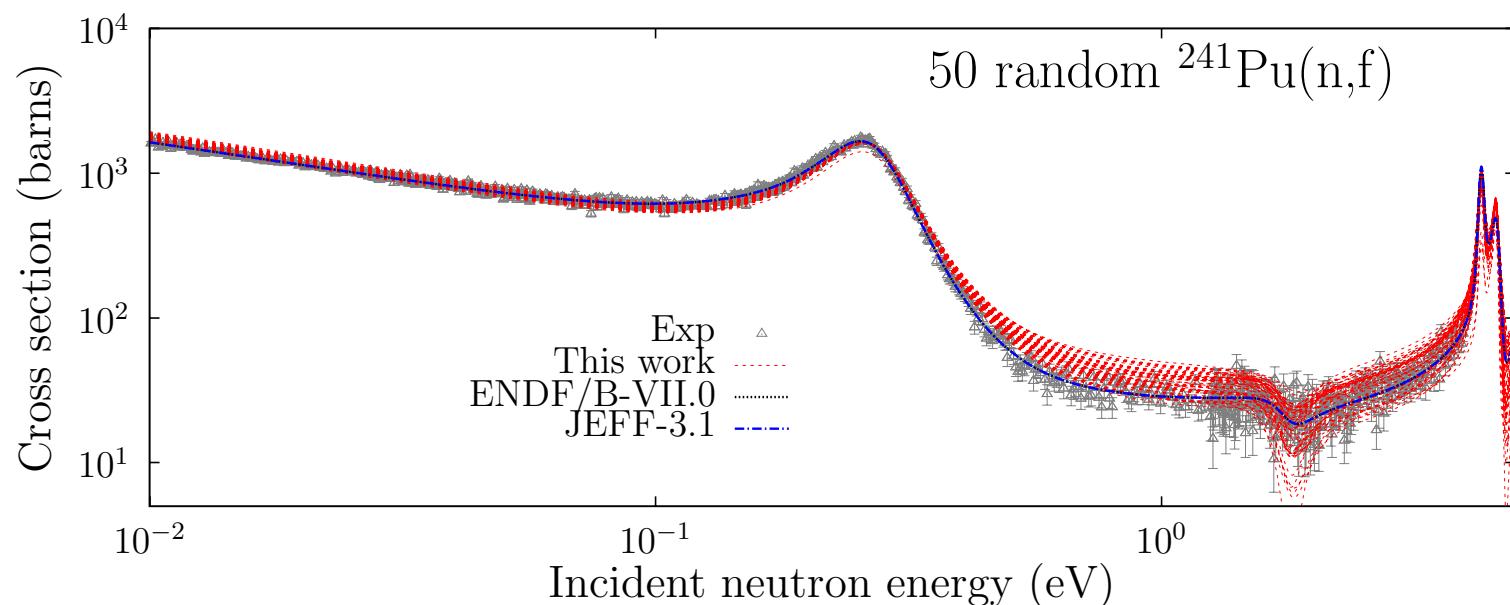

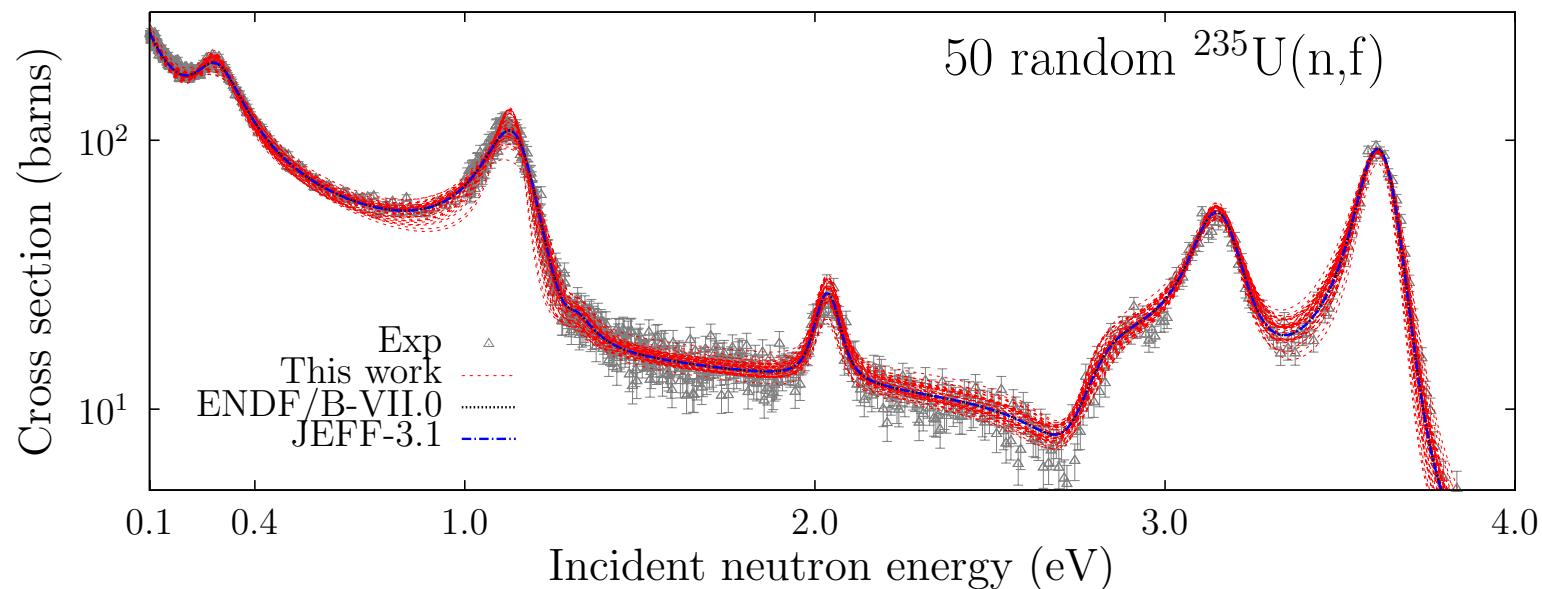

Nuclear data: ^{239}Pu and ^{238}U

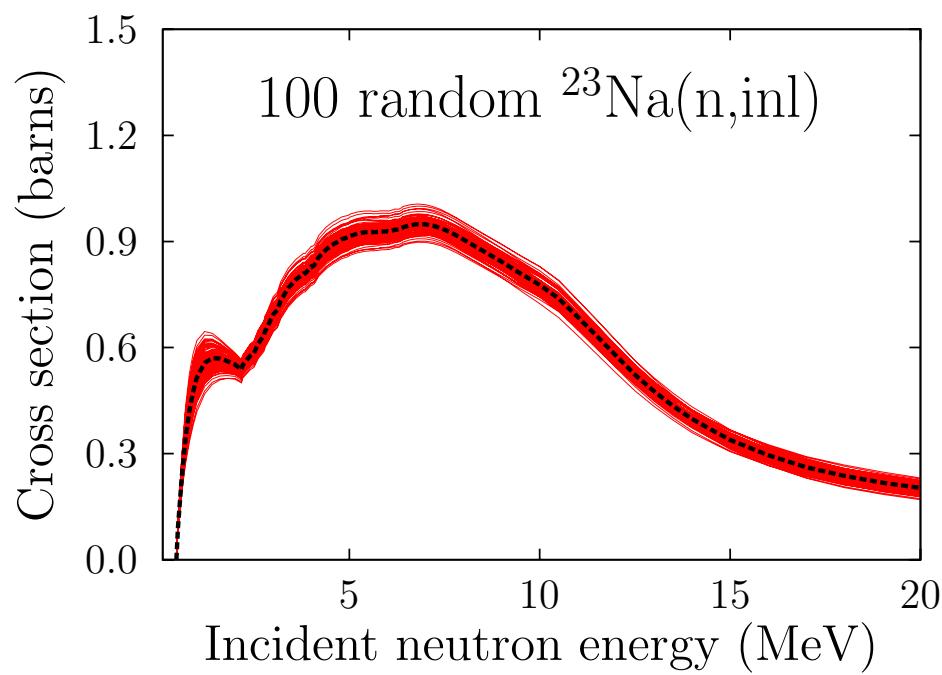

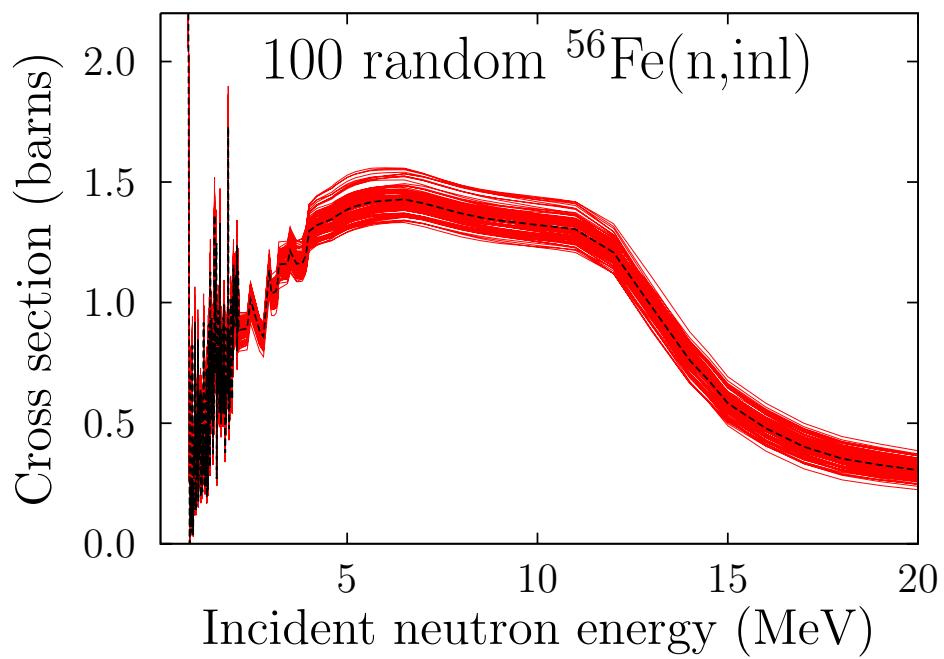

Nuclear data: examples in the resonance region

NRG

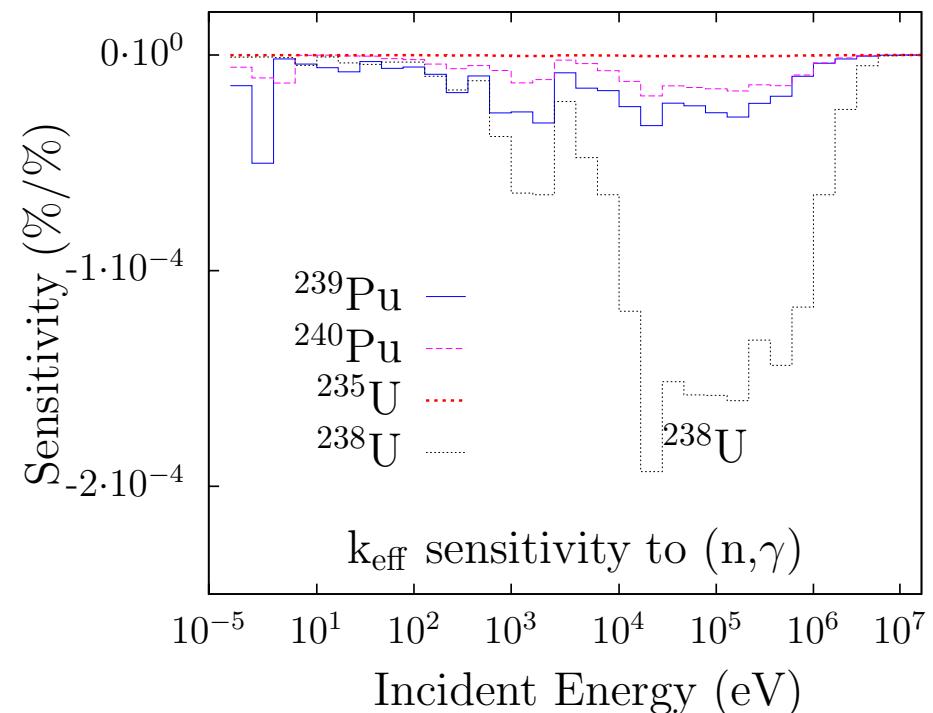

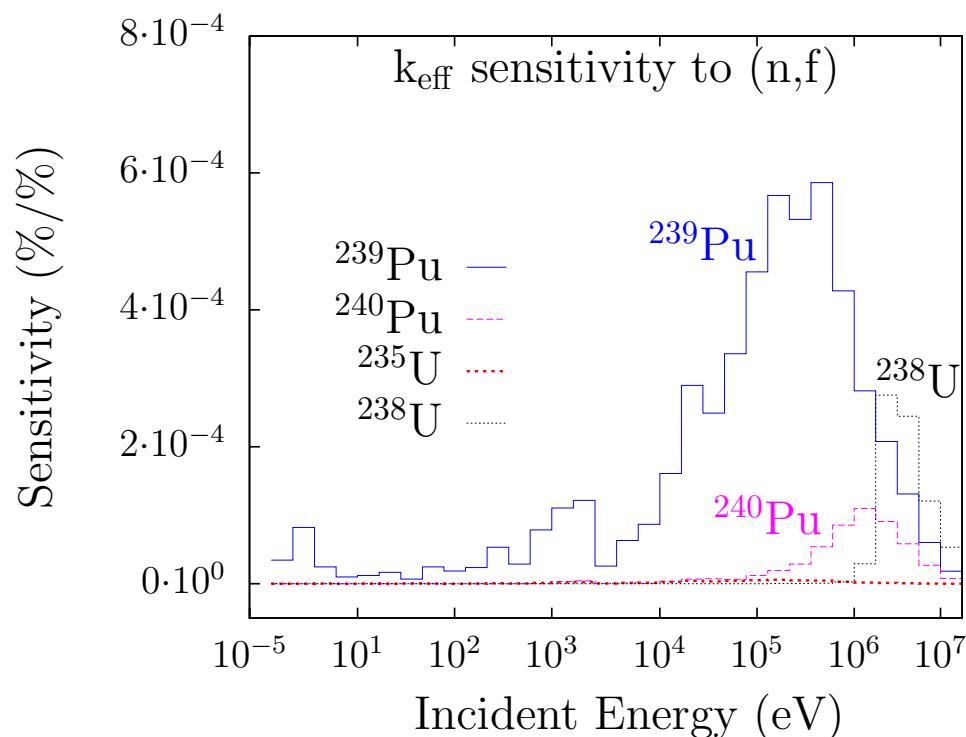

Nuclear data: ^{56}Fe and ^{23}Na

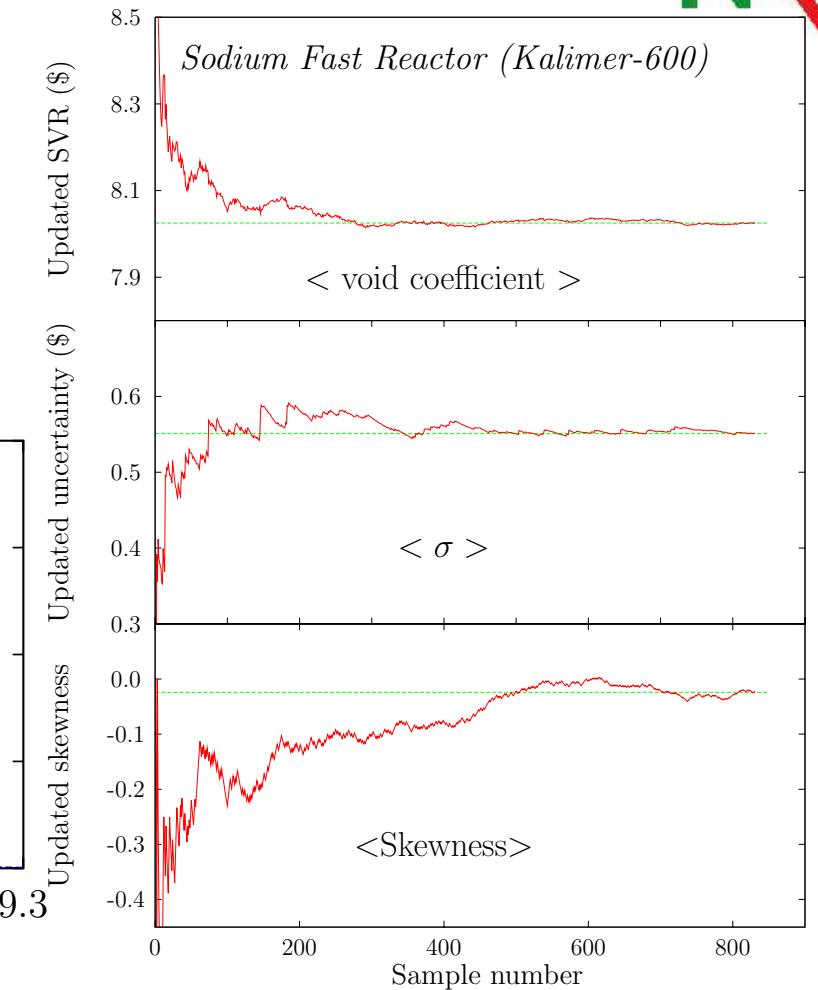

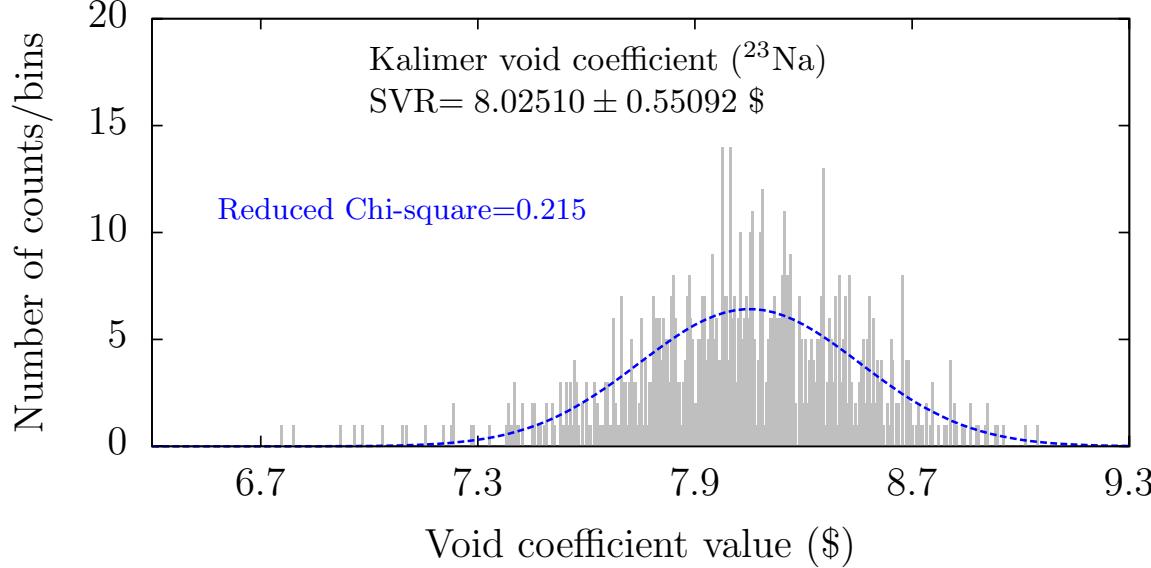

Sensitivities to k_{eff}

Main components: ^{23}Na , ^{56}Fe , Zr , ^{238}U , $^{239,240}\text{Pu}$

Most sensitive reactions: $^{239}\text{Pu}(\text{n},\text{f})$ and $^{238}\text{U}(\text{n},\gamma)$

Results on void coefficient $\text{SVR} = \frac{k_2 - k_1}{k_1 k_2} \frac{1}{\beta_{\text{eff}}}$

Uncertainty on the void coefficient due to nuclear data using the TMC and perturbation methods

Isotope	Varied Nuclear data	Uncertainty on SVR	Method
^{23}Na	all	$\simeq 6\%$	TMC
^{238}U	(n,inl)+(n, γ)	$\simeq 2\%$	Pert.
^{239}Pu	(n,f) +(n, γ)	$\simeq 2\%$	Pert.
^{239}Pu	all	$\simeq 2.5\%$	TMC
^{240}Pu	(n,f) +(n, γ)	$\simeq 0.1\%$	Pert.
^{56}Fe	(n,inl)	$\simeq 0.1\%$	Pert.
^{90}Zr	(n,inl)+(n, γ)	< 0.1 %	Pert.

Uncertainty on k_{eff} due to nuclear data using the TMC and perturbation methods

Isotope	Varied	Uncertainty on k_{eff} (pcm)	Method
			Nucl. data.
^{238}U	(n, γ)	1000	Pert.
^{239}Pu	all	800	TMC
^{239}Pu	(n,f)	700	Pert.
^{240}Pu	(n,f)	600	Pert.
^{238}U	(n,inl)	300	Pert
^{239}Pu	(n, γ)	260	Pert.
^{23}Na	all	130	TMC
^{241}Pu	(n,f)	120	Pert.
^{56}Fe	(n,inl)	100	Pert.

Conclusions and Future improvements

- 👉 Two methods were applied to propagate nuclear data uncertainties for a Kalimer model
- 👉 Main isotopes were considered ($^{239,240}\text{Pu}$, $^{235,238}\text{U}$, ^{23}Na , ^{56}Fe , ^{90}Zr)
- 👉 Results in agreement with previous studies (SG-26) for *initial target accuracies*
- 👉 Better evaluation work is necessary to meet *final target accuracies*
- 👉 Consider all nuclear data with the TMC method
- 👉 Obtain uncertainty on burn-up (isotope content at the end of cycle)
