TENDL-2019beta: (release date: end of 2019)

Last update: 13 april 2019

TENDL is a nuclear data library which provides the output of the TALYS nuclear model code system for direct use in both basic physics and applications. The 10th version is TENDL-2019, which is based on both default and adjusted TALYS calculations and data from other sources (previous releases can be found here: [2008](#), [2009](#), [2010](#), [2011](#), [2012](#), [2013](#), [2014](#), [2015](#)), and . [2017](#)).

Up to 2014, TENDL was produced at NRG Petten. Since 2015, TENDL is mainly developed at PSI and the IAEA (Nuclear Data Section). Still, many people contributes to TENDL with the testing and processing of the files.

- All slides are available here: https://tendl.web.psi.ch/bib_rochman/presentation.html

What is the TENDL project ?

- TENDL: TALYS evaluated nuclear data library,
- Goal: improve simulations for TENDL and/or other libraries, or solving

$$0 \leq \chi^2 \leq 1$$

$$\chi^2 = \frac{1}{n} \sum_{i=1}^n \left(\frac{C_i - E_i}{\Delta E_i} \right)^2$$

- Available at <https://tendl.web.psi.ch/home.html>
- Comes from T6 (software package)
- T6 leads to TENDL, TMC, BMC, HFR...
- See for instance NDS 155 (2019) 1

(Received 3 August 2018; revised received 7 November 2018; accepted 29 November 2018)

What is the TENDL project ?

- TENDL is in fact a by-product of a series of codes,
- This is one fundamental difference with other libraries (no manual work),
- It allows to perform „TMC“ for Total Monte Carlo (uncertainty propagation)
- Methods: reproducibility & completeness, development of a portable system, and making use of the knowledge included in other libraries (JEFF, ENDF/B, JENDL),
- Background: theoretical calculations (TALYS) with experimental inputs, with original resonance evaluations,
- Impact:
 - TENDL-2008 to 2017 (2800 isotopes),
 - Neutrons, protons, deuterons, tritons, He3, alpha and gamma induced,
 - all isotopes, all cross sections with covariances, 0-200 MeV,
 - more than 300 isotopes in the NEA JEFF-3.3 library,
 - more than 50 isotopes in the US ENDF/B-VIII.0 library,
 - more than 450 publications using TENDL

What is the TENDL project ?

TENDL citations

TENDL-2019, what is new ?

- To be release at the end of 2019
- Mainly developed between IAEA and PSI
- Beta versions already available
(https://tendl.web.psi.ch/tendl_2019/tendl2019.html)
- Similar structure as the previous TENDL
 - 2813 isotopes, 200 MeV, with covariances
 - Neutrons, protons, deuterons, tritons, He3, alphas, and gammas
- New and simplified T6 available “on demand”
- TALYS-1.95 (above resonances)
- TARES-1.4 (resonances)
- NJOY-2016
- PREPRO-2018
- Other codes/tools
- New “library” database (comparisons, import...)

TENDL-2019, what is new ?

- New T6:
 - Newest code versions,
 - more verifications,
 - Linux RedHat/Mac,
 - tested with latest compilers

- Similar structure as the previous TENDL libraries
 - 2813 isotopes, 200 MeV, with covariances
 - Neutrons, protons, deuterons, tritons, He3, alphas, and gammas
 - ACE (PURR for all isotopes, gamma production (iopp=1) included)?
 - ENDF-6 files in different options (MF3 MT5 at 0, 20 or 60 MeV)
 - EAF files
 - MF32 and/or MF33
 - Input files
 - Random files

TENDL-2019, what is new ?

- TALYS-1.95/TEFAL

- Improved photon strength function: Simplified Modified Lorentzian (better estimated of neutron capture c.s.)
- 30 MeV spectrum problem found by Kwon/Konno solved
- Improvement of specific nuclides (esp. Ni isotopes)
- Includes correct isomeric branching ratios for thermal neutron capture cross sections, e.g. $^{93}\text{Nb}(n, \text{gamma})^{94\text{m}}\text{Nb}$ (~50 cases)
- Isomeric production of discrete level number > 30 implemented, solves remaining decay heat problems from CCFE benchmarks

TENDL-2019, what is new ?

- TARES-1.4: resonance formatting and analyzing tool
- Measured/compiled/evaluated resonances:
 - Based on latest JENDL-4.0, ENDF/B-VIII.0 and JEFF-3.3
 - Based on the latest Atlas, 6th edition (2018)
- Statistical resonances:
 - Based on CALENDF
 - Translating the unresolved range from TALYS into statistically resolved range
 - Consistency between the RRR, URR and fast range
- Covariances in MF32 and MF33
 - Consistency between both format
 - Consistent with the random files (using the ENDSAM from IJS)

Conclusion and future

- The TENDL library is improving year after year, TENDL-2019 being (hopefully) a better set
- The new T6 code package allows to produce TENDL, random files and to go further,
- Still, as proven by distributing T6, many improvements are necessary
- Good example for the future expert group on “Modern Nuclear Data Evaluation Methods”
- Future:
 - TENDL based on TALYS-2.0
 - Include reaction data not yet in TENDL
 - Evaluated Gamma-ray Activation File (EGAF)
 - Prompt Fission Gamma Spectra
 - Produce FY library at every release
 - Correct TALYS, experiments and linearity: GP+ MLO + LM from UU
(*Gaussian process + Marginal Likelihood Optimization + Levenberg-Marquardt*
UU: Uppsala University)
